Discovery and development of beta-blockers β adrenergic receptor antagonists (also called beta-blockers or β-blockers) were initially developed in the 1960s, for the treatment of angina pectoris but are now also used for hypertension, congestive heart failure and certain arrhythmias. Although DCI had no clinical utility, a change in the compound did provide a clinical candidate, pronethalol, which was introduced in 1962. Inderal, only two and a half years after it had first been tested. In the 1950s, dichloroisoproterenol (DCI) was discovered to be a β-antagonist that blocked the effects of sympathomimetic amines on bronchodilation, uterine relaxation and heart stimulation. It turned out to have a higher potency than pronethalol, with fewer side effects d95cef83ef

Postural orthostatic tachycardia syndrome POTS is a disorder of the autonomic nervous system that can lead to a variety of symptoms. The selective Postural orthostatic tachycardia syndrome (POTS) is a condition characterized by an abnormal increase in heart rate upon sitting up or standing. However, it may cause GI side effects that limit its use in around 20% of its patient population. Upon standing, individuals can experience lightheadedness, blurred vision, heart palpitations, weakness and tremor (shaking). approximately half of POTS patients reviewed. This increased heart rate should occur in the absence of a significant drop in blood pressure. POTS in adults is characterized by a heart rate increase of 30 beats per minute within ten minutes of standing up, accompanied by other symptoms. In addition, individuals can experience fatigue, headaches, brain fog, exercise intolerance, nausea, difficulty concentrating, chest pain, and shortness of breath d95cef83ef

The proportion of patients in the population with CDH who overuse acute medications ranges from 18% to 33%. The prevalence of MOH varies depending on the population studied and diagnostic criteria used. However, it is estimated that MOH affects approximately 1-2% of the general population, but its relative frequency is much higher in secondary and tertiary care. Medication overuse is responsible for more than 20% of all headache-related disability globally... d95cef83ef

Medication overuse headache They typically occur in patients with an underlying headache disorder such as migraine or tension-type headache that "transforms" over time from an episodic condition to chronic daily headache due to excessive intake of acute headache relief medications. Elavil (amitriptyline), Depakote (valproate), Topamax (topiramate), and Inderal (propranolol). [medical citation needed] MOH is common and can be treated A medication overuse headache (MOH), also known as a rebound headache, usually occurs when painkillers are taken frequently to relieve headaches. Rebound headaches frequently occur daily, can be very painful and are a common cause of chronic daily headache (CDH). These cases are often referred to as painkiller headaches d95cef83ef
