Congdon is the author of four books. The first three were *The Young Lukacs* (1983), *Exile and Social Thought* (1991), and *Seeing Red* (2001). Taken together, the works represent a trilogy examining the contributions of Hungarian intellectuals to 20th century social and political thought. His fourth book was *George Kennan: A Writing Life* (2008). Congdon also co-edited two books on the Hungarian Revolution. In 1869, legislation liberalized apprenticeship training, removing restrictions on who could take on apprentices. In 1881, 1884, and 1887, legislation tightened... Calculation ==

Factorization of polynomials $q = \{\frac{p}{c}\},$ where $p \in \mathbb{Z}[X]$ and $c \in \mathbb{Z}$: it suffices to take for c a multiple of all denominators of the coefficients of q (for example their product) In mathematics and computer algebra, factorization of polynomials or polynomial factorization expresses a polynomial with coefficients in a given field or in the integers as the product of irreducible factors with coefficients in the same domain. Polynomial factorization is one of the fundamental components of computer algebra systems

Index of coincidence ("kappa-plaintext") rather than IC, with k_r ("kappa-random") used to denote the denominator $1/c$ (which is the expected coincidence rate for a uniform distribution In cryptography, coincidence counting is the technique (invented by William F. Friedman) of putting two texts side-by-side and counting the number of times that identical letters appear in the same position in both texts

The German model of collective bargaining differs from the model common in other European countries and the United States. In Germany, unions and employer associations bargain at the industry-region level. In contrast to tripartite corporatist systems, the German government is not involved in the negotiations. These large-scale agreements have broad coverage and lead to considerable standardization in wages and employment conditions across the country. Some bargaining occurs at the firm level. The first

polynomial factorization algorithm was published by Theodor von Schubert in 1793. Leopold Kronecker rediscovered Schubert's algorithm in 1882 and extended it to multivariate polynomials and coefficients in an algebraic extension. But most of the knowledge on this topic is not older than circa 1965 and the first computer algebra systems: 7ce07c0ecc

== Definition and basic calculation == 7ce07c0ecc Dividend yield measures dividend income only; it does not include changes in the share price and therefore differs from total return. Reported yields depend on convention: some use a trailing yield, or dividends paid over the previous 12 months, while others use a forward yield, or an indicated dividend based on recent declarations, which may exclude special dividends. Because both dividends and prices can change, a high dividend yield can reflect a higher payout, a lower share price, or expectations that dividends will be reduced. 7ce07c0ecc Cardinal numbers refer to the size of a group. In English, these words are numerals. 7ce07c0ecc

The methods aim to treat voters equally by ensuring legislators represent an equal number of voters by ensuring every party has the same seats-to-votes ratio (or divisor). Such methods divide the number of votes by the number of votes per seat to get the final apportionment. By doing so, the method maintains proportional representation, as a party with e.g. twice as many votes will win about twice as many seats. 7ce07c0ecc y 7ce07c0ecc

Polynomial greatest common divisor In algebra, the greatest common divisor (frequently abbreviated GCD or gcd) of two polynomials is a polynomial, of the highest possible degree, which is In algebra, the greatest common divisor (frequently abbreviated GCD or gcd) of two polynomials is a polynomial, of the highest possible degree, which is a factor of both the two original polynomials. This concept is analogous to the greatest common divisor of two integers

German model The system of vocational The term German model is most often used in economics to describe post-World War II West Germany's means of using (according to University College London Professor Wendy Carlin) innovative industrial relations, vocational training, and closer relationships between the financial and industrial sectors to cultivate economic prosperity. The two key components of the German model is a national system for certifying industrial and artisan skills, as well as full union participation in the oversight of plant-based vocation training. of the non-confrontational culture of postwar Germany, finding a common denominator was often the main goal in such relationships

gcd == Asian languages == Divisor methods were first invented by Thomas... (Because letters in a natural language are not distributed evenly, the IC is higher for such texts than it would be for uniformly random text strings. What makes the IC especially useful is the fact that its value does not change if both texts are scrambled by the same single-alphabet substitution cipher, allowing a cryptanalyst to quickly detect that form of encryption. == History == The divisor methods are generally preferred by social choice theorists and mathematicians to the largest remainder methods, as they produce more-proportional results by most metrics and are less susceptible to apportionment paradoxes. In particular, divisor methods avoid the population paradox and spoiler effects, unlike the largest remainder methods. In the important case of univariate polynomials over a field, the polynomial GCD may be computed as for the integer GCD, with the Euclidean algorithm using long division. The polynomial GCD is defined only up to the multiplication by an invertible constant. When the long-known finite step algorithms were first put on computers, they turned out to be highly inefficient. The fact that almost any uni- or multivariate polynomial of degree up to 100 and with coefficients of a moderate size (up to 100 bits) can be factored by modern algorithms in a few minutes of computer time indicates how successfully this problem has been attacked during the past fifteen years. (Erich Kaltofen, 1982)

Cardinal numbers History Dividend yield is the ratio of a share's annualised cash dividend to its current market price,... The index of coincidence provides a measure of how likely it is to draw two matching letters by randomly selecting two letters from a given text. The chance of drawing a given letter in the text is (number of times that letter appears / length of the text). The chance of drawing that same letter again (without replacement) is (appearances – 1 / text length – 1). The product of these two values gives... Closely related measures compare dividends to price and are often referred to as the dividend-price ratio. At the company level, the same idea can be expressed as total annual dividends divided by the company's market capitalisation, assuming the number of shares remains unchanged.

Dividend yield different timing conventions for dividends and the price used in the denominator. It is usually expressed as a percentage and is commonly calculated by dividing the annual dividend per share by the current share price. The reciprocal measure is sometimes expressed as a price-dividend ratio The dividend yield of a share is the ratio of annualised cash dividends to the share's current market price

The similarity between integer GCD and polynomial GCD allows extending to univariate polynomials all the properties that may be deduced from the Euclidean algorithm and Euclidean division. Moreover, the polynomial GCD has specific properties that make it a fundamental notion in various areas of algebra. Typically, the roots of the GCD of two polynomials are the common roots of the two polynomials, and this provides information on the roots without computing them. For example, the multiple roots of a polynomial are the roots of the GCD of the polynomial and its derivative, and further GCD computations allow computing the square-free factorization of the polynomial... 7ce07c0ecc In 1999 Congdon was awarded the Order of Merit of the Republic of Hungary - Small Cross.
