

How Long Is The Rectum

== Plot == The anal canal is traditionally divided into two segments, upper and lower, separated by the pectinate line (also known as the dentate line): Rectal prolapse is generally diagnosed more commonly in elderly women, although it may occur at any age and any sex. It is very rarely life-threatening, but the symptoms can be debilitating if left untreated. Most external prolapse cases can be treated successfully, often with a surgical procedure. Internal prolapses are traditionally harder to treat and surgery may not be suitable for many patients. **== Structure ==**

Anal fissure Diseases of the Colon and Rectum. 49 (6): 858-864 An anal fissure is a break or tear in the skin of the anal canal. Anal fissure is a common condition although published epidemiological data are limited. Symptoms associated with acute fissures include pain with defecation, anal spasm, and bleeding with defecation. Eran (2001). Surgical treatment, if required, has a high success rate. Fissures persisting for longer than 4 weeks, or recurrent

fissures, are defined as chronic. Half of patients with fissures heal with nonoperative management. "Long-term results of "chemical sphincterotomy" for chronic anal fissure: a prospective study" dba3bafbff

Although the exact cause of anal fissure is unknown, most anal fissures are thought to be due to trauma to the anal mucus membrane most commonly from the passage of large, hard stools, or repeated irritation from chronic diarrhea. dba3bafbff Anoscopy is recommended for people who are experiencing symptoms such as rectal bleeding, persistent pain in the anus, constipation or fecal incontinence. Anoscopy is also done in cases where the doctor suspects conditions such as hemorrhoids, anal fissures, fistula, abscesses in the anal area, inflammation near or in the anus, perianal/rectal tumors, some types of rectal or mucosal prolapses or rectal cancer. dba3bafbff == Causes == dba3bafbff == Procedure == dba3bafbff Although the procedure and general goals may be similar, transanal irrigation is different from colon cleansing (colon hydrotherapy), which is a term used in alternative medicine. Transanal irrigation is used for medical conditions which affect defecation, such as spinal cord injury or multiple sclerosis. Colon cleansing is used outside of mainstream medical supervision, and may be used in the belief that the procedure removes toxins from the body. dba3bafbff Earl returns home and tells his girlfriend Lake that he has to leave town

SCAD is unknown, but may be related to local colonic ischemia, fecal stasis, or mucosal
prolapse. The factors that cause SCAD likely overlap with inflammatory bowel disease. There
are four types of SCAD, which are categorized based on the appearance during colonoscopy.
Pattern A is characterized by involvement of crescentic folds and is the most common type of
SCAD (52%). Pattern B has an appearance similar to mild-to moderate ulcerative colitis
(30.40%), whereas pattern C appears similar to Crohn's disease (10.90%). Pattern D is the
least common and appears similar to severe ulcerative colitis (6.50%). dba3bafbff The Death

Anal vibrators differ from other types of vibrators in that they have a flared base to prevent possible loss in the rectum. The average size of an anal vibrator is smaller than vibrators intended for vaginal penetration and may vary from 4-6 inches long and about 1 inch wide. As well as other vibrators designed for external and internal stimulation, anal vibrators are usually battery-operated: the batteries may be inside the unit or connected by wire to a power pack. dba3bafbff

Obstructed defecation Normal definitions of functional Obstructed defecation syndrome (abbreviated as ODS, with many synonymous terms) is a major cause of functional constipation (primary constipation), of which it is considered a subtype. In contrast, ODS may occur with frequent bowel movements and even with soft stools, and the colonic transit time may be normal (unlike slow transit constipation), but delayed in the rectum and sigmoid colon. characterized by difficult and/or incomplete emptying of the rectum with or without reduction in the frequency of bowel movements. In humans, the anal canal is approximately 2.5 to 4 cm (0.98 to 1.57 in) long, from the anorectal junction to the anus. It is directed downwards and backwards. It is surrounded by inner involuntary and outer voluntary sphincters which keep the lumen closed in the form of an anteroposterior slit. dba3bafbff

Anal vibrator All anal vibrators have one common feature: they produce a vibrating effect in the rectum for pleasurable sensations. The average size of an anal vibrator is smaller than vibrators intended for vaginal penetration and may vary from 4-6 inches long and An anal vibrator is a vibrator designed for sexual stimulation of the anus of both men and women. in the rectum dba3bafbff

Unlike anal dildos, such as butt plugs, anal probes and anal beads, vibrating anal toys may produce various stimulating effects: rotating, vibrating or pulsating, and can have different speeds or vibration levels to regulate and adjust the vibrator to various sensations. dba3bafbff Most anal fissures are in the midline. If they occur off the midline, they warrant

evaluation for an underlying diagnosis such as Crohn's disease, HIV/AIDS, and associated secondary infections, ulcerative colitis, tuberculosis, syphilis, leukemia, or cancer.

Anal canal The anus is the aperture at the terminal portion of the anal canal. The anal canal is the part that connects the rectum to the anus, located below the level of the pelvic diaphragm. It is located within the anal triangle. The anal canal is the part that connects the rectum to the anus, located below the level of the pelvic diaphragm. It is located within the anal triangle of the perineum, between the right and left ischioanal fossae. As the final functional segment of the bowel, it functions to regulate release of feces by two muscular anal sphincter complexes.

Types of anal vibrators The impact of transanal irrigation varies considerably. Some individuals experience complete control of incontinence, and other report little or no benefit. Evidence shows this treatment can be considered for children as well. When diet and medication has proven ineffective, transanal irrigation may be used.

rectal prolapse, depending on whether the prolapsed section is visible externally, and whether the full or only partial thickness of the rectal wall is involved.
