While the formulations can vary, most Essiac formulations contain burdock root, turkey rhubarb root, sheep sorrel and slippery elm. From the 1920s through the 1970s, Essiac was promoted as a cancer treatment by Rene Caisse, a Canadian nurse who invented the formula. Caisse claimed at some times that the formula had been given to her by an Ontario Ojibwa patient she treated, and at other times that she had learned the formula from an unnamed "medicine man". Neither story has ever been substantiated. There is no evidence that Essiac is a Native American or First Nations remedy. However, there are multiple factors that indicate the formula is not from any Native American or First Nations culture. Notably, in the original recipe, only one of the plants in the mixture, slippery elm, is indigenous to the Americas; none of the other herbs are native to North America. Caisse changed her story about the origins of...

Essiac There is no evidence it is beneficial to health. In a number of studies Essiac either showed no action against cancer cells, or actually increased the rate of cancer growth. From the 1920s through Essiac is a herbal tea promoted as an alternative treatment for cancer and other illnesses. While the formulations can vary, most Essiac formulations contain burdock root, turkey rhubarb root, sheep sorrel and slippery elm c5df18aabf

Amphibian In its broadest sense, it is a paraphyletic group encompassing all tetrapods, but excluding the amniotes (tetrapods with an amniotic membrane, such as modern reptiles, birds and mammals). However, many of the causes of amphibian declines
Amphibians are ectothermic, anamniotic, four-limbed vertebrate animals that constitute the class Amphibia. to be especially damaging to the skin, eyes, and eggs of amphibians), and diseases like chytridiomycosis. All extant (living) amphibians belong to the monophyletic subclass Lissamphibia, with three living orders: Anura (frogs and toads), Urodela (salamanders), and Gymnophiona (caecilians). Evolved to be mostly semiaquatic, amphibians have adapted to inhabit a wide variety of habitats, with most species living in freshwater, wetland or terrestrial ecosystems (such as riparian woodland, fossorial and even arboreal habitats). Their life cycle typically starts out as aquatic larvae with gills known as tadpoles, but some species have developed behavioural adaptations to bypass this
