Low back pain Low back pain may be classified by duration as acute (pain lasting less than 6 weeks), sub-acute (6 to 12 weeks), or chronic (more than 12 weeks). spinal tumors, fracture of the spine, and infections, among others. There are a number of ways to classify low Low back pain or lumbago is a common disorder involving the muscles, nerves, and bones of the back, in between the lower edge of the ribs and the lower fold of the buttocks. The symptoms of low back pain usually improve within a few weeks from the time they start, with 40-90% of people recovered by six weeks.

The ICD 10 code for low back pain is M54. Pain can vary from a dull constant ache to a sudden sharp feeling. 5

If the pain does not go away with conservative treatment or if it is accompanied by "red flag" symptoms such as unexplained weight loss, fever, or significant problems with feeling or movement, further testing may be needed to look for a serious underlying problem. In most cases, imaging tools such as CT scans are not useful or recommended for low back pain that lasts less than 6 weeks (with no red flags) and carry their own risks. DMSA scan A DMSA scan is a radionuclide scan that uses dimercaptosuccinic acid (DMSA) in assessing renal morphology, structure and function. However, the sensitivity of DMSA scan for acute pyelonephritis may be as low as 46%. Radioactive technetium-99m is combined with DMSA and injected into a patient, followed by imaging with a gamma camera after 2-3 hours. sometimes used as a test for the diagnosis of acute pyelonephritis. A DMSA scan is usually static imaging, while other radiotracers like DTPA and MAG3 are usually used for dynamic imaging to assess renal excretion 0af08be6b8

Common signs and symptoms include fever, increased heart rate, increased breathing rate, and confusion. There may also be symptoms related to a specific infection, such as a cough with pneumonia, or painful urination with a kidney infection. The very young, old, and people with a weakened immune system may not have any symptoms specific to their infection, and their body temperature may be low or normal instead of constituting a fever. Severe sepsis may cause organ dysfunction and significantly reduced blood flow. The presence of low blood pressure, high blood lactate, or low urine output may suggest poor blood flow. Septic shock is low blood pressure due to sepsis that does not improve after fluid replacement or requires medications to raise the blood pressure. 0af08be6b8 (S)-Equol 0af08be6b8 Detection and/or evaluation of a renal scar, especially in patients having vesicoureteric reflux (VUR) 0af08be6b8 (R,R)-Tetrahydrochrysene 0af08be6b8 2014 Democratic Republic of the Congo Ebola virus outbreak 0af08be6b8 17 α -
