

Dyspnea While Lying Down

== Risk factors == Since paroxysmal nocturnal dyspnea occurs mainly because of heart or lung problems, common risk factors include those that affect the function of the heart and lungs. Risk factors for cardiac diseases include high blood pressure, high cholesterol, diabetes, obesity, and a lifestyle lacking exercise and a healthy diet. Risk factors for lung diseases include tobacco use, including second hand smoke, pollution, exposure to hazardous fumes, and allergens.

Paroxysmal nocturnal dyspnoea PND, as well as simple orthopnea, may be relieved by sitting upright at the side of the bed with legs dangling, as symptoms typically occur when the person is recumbent, or lying down. Since paroxysmal nocturnal dyspnea occurs mainly because of heart or lung problems, common Paroxysmal nocturnal dyspnea or paroxysmal nocturnal dyspnoea (PND) is an attack of severe shortness of breath and coughing that generally occurs at night. It usually awakens the person from sleep, and may be quite frightening. symptoms typically occur when the person is recumbent, or lying down

Cat communication Cats. accompanied by other symptoms, such as coughing or shallow breathing (dyspnea), is considered to be abnormal and is treated as a medical emergency

Heart cancer usually have non-specific symptoms, such as dyspnea (in particular, shortness of breath when lying down), thoracoabdominal pain (pain in the general

Orthopnea is often a symptom of left ventricular heart failure and/or cardiogenic pulmonary edema. It can also occur in those with asthma and chronic bronchitis, as well as those with sleep apnea or panic disorder. It is also as associated with polycystic liver disease. From a neuromuscular perspective, orthopnea is potentially a sign of severe diaphragmatic weakness. Under such circumstances, patients may describe shortness of breath when they bend over (e.g. when tying shoelaces), called bendopnea.

Bendopnea breath while lying down), trepopnea (shortness of breath while lying on one side), and platypnea (shortness of breath relieved by lying down and worsened

Pulmonary edema orthopnea (inability to breathe sufficiently when lying down flat) and/or paroxysmal nocturnal dyspnea (episodes of severe sudden breathlessness at night)

The Nightmare Sleep and dreams were common subjects for Fuseli.

sleeper's experience of weight on the chest combined with sleep paralysis, dyspnea, or a feeling of dread 3504cd3d25

Heart failure experience shortness of breath (dyspnea) on exertion and, in severe cases, dyspnea at rest. Increasing breathlessness while lying down, called orthopnea, also 3504cd3d25

Orthopnea Orthopnea or orthopnoea is shortness of breath (dyspnea) that occurs when lying flat, causing the person to have to sleep propped up in bed or sitting Orthopnea or orthopnoea is shortness of breath (dyspnea) that occurs when lying flat, causing the person to have to sleep propped up in bed or sitting in a chair. It is commonly seen as a late manifestation of heart failure, resulting from fluid redistribution into the central circulation, causing an increase in pulmonary capillary pressure and causing difficulty in breathing. Orthopnea is the opposite of platypnea, shortness of breath that worsens when sitting or standing upright. It is also seen in cases of abdominal obesity or pulmonary disease 3504cd3d25

Pericardial effusion complication, may present with dyspnea, low blood pressure, weakness, restlessness, hyperventilation (rapid breathing), discomfort with lying flat, dizziness, syncope 3504cd3d25

Valvular heart disease A third heart sound may be present Patients with mitral stenosis may present with heart failure symptoms, such as dyspnea on. beat down and to the left 3504cd3d25
