Kleihauer-Betke test The Kleihauer-Betke ("KB") test, Kleihauer-Betke ("KB") stain, Kleihauer test or acid elution test is a blood test used to measure the amount of fetal The Kleihauer-Betke ("KB") test, Kleihauer-Betke ("KB") stain, Kleihauer test or acid elution test is a blood test used to measure the amount of fetal hemoglobin transferred from a fetus to a mother's bloodstream. It is usually performed on Rh-negative mothers to determine the required dose of Rho(D) immune globulin (RhIg) to inhibit formation of Rh antibodies in the mother and prevent Rh disease in future Rh-positive children. It is named after Enno Kleihauer and Klaus Betke who described it in 1957 8c2c9140ac

Unlike alcohol, for which impairment can be reasonably measured using a breathalyser (and confirmed with a blood alcohol content measurement), valid detection for cannabis is time-consuming, and tests cannot determine an approximate degree of impairment. The lack of suitable tests and agreed-upon intoxication levels is an issue in the legality of cannabis, especially regarding intoxicated driving. 8c2c9140ac == Extraction == 8c2c9140ac == Discovery == 8c2c9140ac

Blood test Multiple tests for specific blood components, such as a glucose test or a cholesterol test, are often grouped together into one test panel called a blood panel or blood work. A blood test is a laboratory analysis performed on a blood sample that is usually extracted from a vein in the arm using a hypodermic needle, or via fingerprick A blood test is a laboratory analysis performed on a blood sample that is usually extracted from a vein in the arm using a hypodermic needle, or via fingerprick. Blood tests are also used in drug tests to detect drug abuse. Blood tests are often used in health care to determine physiological and biochemical states, such as disease, mineral content, pharmaceutical drug effectiveness, and organ function. Typical clinical blood panels include a basic

metabolic panel or a complete blood count 8c2c9140ac

Cannabis drug testing Cannabis use is highly detectable and can be detected by urinalysis, hair analysis, as well as saliva tests for days or weeks. saliva tests for days or weeks. Unlike alcohol, for which impairment can be reasonably measured using a breathalyser (and confirmed with a blood alcohol Cannabis drug testing describes various drug test methodologies for the use of cannabis in medicine, sport, and law 8c2c9140ac

Tin(II) chloride SnCl_2 is widely used as a reducing agent (in acid solution), and in electrolytic baths for tin-plating. It forms a stable dihydrate, but aqueous solutions tend to undergo hydrolysis, particularly if hot. Tin(II) chloride should not be confused with the other chloride of tin; tin(IV) chloride or stannic chloride (SnCl_4). It forms a stable dihydrate, but aqueous solutions Tin(II) chloride, also known as stannous chloride, is a white crystalline solid with the formula SnCl_2 . Tin(II) chloride, also known as stannous chloride, is a white crystalline solid with the formula SnCl_2 8c2c9140ac

Suxamethonium chloride Suxamethonium chloride (brand names Scoline and Sucostrin, among others), also known as suxamethonium or succinylcholine, or simply sux in medical abbreviation, is a medication used to cause short-term paralysis as part of the process of general anesthesia. When used in a vein, onset of action is generally within one minute and effects last for up to 10 minutes. Common side effects of suxamethonium chloride include low blood pressure, increased saliva production, muscle pain, and rash. last for up to 10 minutes. It is administered by injection, either intravenously or intramuscularly. This is done to help with tracheal intubation or electroconvulsive therapy 8c2c9140ac

PVC comes in rigid (sometimes abbreviated as RPVC) and flexible forms. Rigid PVC is used in construction for pipes, doors, and windows. It is also used in making plastic bottles, packaging, and bank or membership cards. Adding plasticizers makes PVC softer and more flexible. It is used in plumbing, electrical cable insulation, flooring, signage, phonograph records, inflatable products, and rubber substitutes. With cotton or linen, it is used in the production of canvas. 8c2c9140ac The

Duquenois-Levine test is commonly used as a screening test in the field, but it cannot definitively confirm the presence of cannabis, as a large range of substances have been shown to give false positives. 8c2c9140ac At-home cannabis testing kits are also available, allowing individuals to check THC levels before employment or compliance screenings. Some brands, such as Exploro, provide... 8c2c9140ac == Test details == 8c2c9140ac The KB test is the standard method of quantitating fetal-maternal hemorrhage (FMH). It takes advantage of the differential resistance of fetal hemoglobin to acid. A standard blood smear is prepared from the mother's blood and exposed to an acid bath. This removes adult hemoglobin, but not fetal hemoglobin, from the red blood cells. Subsequent staining, using Shepard's method, makes fetal cells (containing fetal hemoglobin) appear rose-pink in color, while adult red blood cells are only seen as "ghosts". 2,000 cells are counted under the microscope and a percentage of fetal to maternal cells is calculated. 8c2c9140ac

Blood doping vasculogenesis (the creation of new blood vessels). Blood doping can be achieved by making the body produce more red blood cells itself using drugs, giving blood transfusions either from another person or back to the same individual, or by using blood substitutes. Because such blood cells carry oxygen from the lungs to the muscles, a higher concentration in the blood can improve an athlete's aerobic capacity (VO₂ max) and endurance. HIF stabilizers as used by cyclists in combination with cobalt chloride/desferrioxamine to stimulate and Blood doping is a form of doping in which the number of red blood cells in the bloodstream is boosted in order to enhance athletic performance 8c2c9140ac

A chloride ion (diameter 181 pm) is much larger than a chlorine atom (diameter 99 pm). The chlorine atom's hold on the valence shell is weaker because the chloride anion has one more electron than it does. The ion is colorless and diamagnetic. In aqueous solution, it is highly soluble in most cases; however, for some chloride salts, such as silver chloride, lead(II) chloride, and mercury(I) chloride, they are only slightly soluble in... 8c2c9140ac == Electronic properties == 8c2c9140ac Suxamethonium is a neuromuscular-blocking agent (NMBA), and is classified as a depolarizing neuromuscular drug. It works by blocking the action of acetylcholine on skeletal muscles. 8c2c9140ac In the early 20th century, the Russian chemist Ivan Ostromislensky... 8c2c9140ac

Reference ranges for blood tests Reference ranges (reference intervals) for blood tests are sets of values used by a health professional to interpret a set of medical test results from blood samples. Reference ranges for blood tests are studied within the field of clinical chemistry (also known as "clinical biochemistry", "chemical pathology" or "pure blood chemistry"), the area of pathology that is generally concerned with analysis of bodily fluids. (reference intervals) for blood tests are sets of values used by a health professional to interpret a set of medical test results from blood samples 8c2c9140ac

Polyvinyl chloride is a white, brittle solid. It is soluble in ketones, chlorinated solvents, dimethylformamide, THF and DMAc. 8c2c9140ac The concentrations obtained from such analyses can often be helpful in distinguishing active use from passive exposure, elapsed time since use, and extent or duration of use. 8c2c9140ac PVC was synthesized in 1872 by German chemist Eugen Baumann after extended investigation and experimentation. The polymer appeared as a white solid inside a flask of vinyl chloride that had been left on a shelf sheltered from sunlight for four weeks. 8c2c9140ac == Description == 8c2c9140ac Common side effects of suxamethonium chloride include low blood pressure, increased saliva production, muscle pain, and rash. Possible serious side effects include malignant hyperthermia, hyperkalemia and allergic reactions. The use of suxamethonium chloride is not recommended in the treatment of people who are at risk of hyperkalemia (high blood potassium) or with history of myopathy. Use during pregnancy appears to be safe. 8c2c9140ac Chloride salts such as sodium chloride are often soluble in water. It is an essential electrolyte located in all body fluids responsible for maintaining acid/base balance, transmitting nerve impulses and regulating liquid flow in and out of cells. Other examples of ionic chlorides include potassium chloride (KCl), calcium chloride (CaCl₂), and ammonium chloride (NH₄Cl). Examples of covalent chlorides include methyl chloride (CH₃Cl), carbon tetrachloride (CCl₄), sulfuryl chloride (SO₂Cl₂), and monochloramine (NH₂Cl). 8c2c9140ac Blood test results should always be interpreted using the reference range provided by the laboratory that performed the test. 8c2c9140ac A reference range is usually defined as the set of values 95 percent of the normal population falls within (that is, 95% prediction interval). It is determined by collecting data from vast numbers of laboratory tests. 8c2c9140ac

Polyvinyl chloride About 40 million tons of PVC are produced each year. Polyvinyl chloride,

alternatively poly(vinyl chloride), colloquially vinyl or polyvinyl, abbreviated PVC, is the world's third-most widely produced synthetic polymer. Polyvinyl chloride, alternatively poly(vinyl chloride), colloquially vinyl or polyvinyl, abbreviated PVC, is the world's third-most widely produced synthetic polymer of plastic (after polyethylene and polypropylene).

Cobalt(II) chloride Invisible ink: when suspended in solution, cobalt(II) chloride can be made invisible. Cobalt(II) chloride refers to inorganic compounds with the formula $\text{CoCl}_2 \cdot (\text{H}_2\text{O})_n$. The hexahydrate is commonly used in the laboratory. cobalt chloride was the eighth-most-prevalent allergen in patch tests (8.4%). These compounds include anhydrous CoCl_2 as well as several hydrates. The anhydrous form is a blue solid; the dihydrate is purple and the hexahydrate is pink.

SnCl_2 has a lone pair of electrons, such that the molecule in the gas phase is bent. In the solid state, crystalline SnCl_2 forms chains linked via chloride bridges as shown. The dihydrate has three coordinates as well, with one water on the tin and another water on the first. The main part of the molecule stacks into double layers in the crystal lattice, with the "second" water sandwiched between the layers.

Chloride bionumbers.org. Retrieved 30 March 2017. The chloride ion (Cl^-) is the anion of chlorine, that is, chlorine with an extra electron. "Blood (Serum) Chloride Level Test". The term "chloride" is also used non-systematically for chemicals containing chlorine covalently bonded to another atom. Archived from the original on 31 March 2009. Retrieved 24 March 2017. in cells

In those with positive tests, follow up testing at a postpartum... Many methods of blood doping are illegal, particularly in professional sports where it is considered to give an artificial advantage to the competitor. Anti-doping agencies use tests to try to identify individuals who have been blood doping using a number of methods, typically by analyzing blood samples from the competitors.
