Underwater computer vision One reason for this is that, the moment the camera goes into the water, a whole new set of challenges appear. Applications range from inspection of underwater structures for the offshore industry to the identification and counting of fishes for biological research. However, no matter how big the impact of this technology can be to industry and research, it still is in a very early stage of development compared to traditional computer vision. On the other hand, the physical properties of the water make light behave differently, changing the appearance of a same object with variations of depth, organic material, currents, temperature etc. However, no matter how big the impact of this technology can be to industry and research, it still Underwater computer vision is a subfield of computer vision. On one hand, cameras have to be made waterproof, marine corrosion deteriorates materials quickly and access and modifications to experimental setups are costly, both in time and resources. In recent years, with the development of underwater vehicles (ROV, AUV, gliders), the need to be able to record and process huge amounts of information has become increasingly important. identification and counting of fishes for biological research c16580705e
