

What Is A Complete Graph

Graph minor of graph minors began with Wagner's theorem that a graph is planar if and only if its minors include neither the complete graph K_5 nor the complete bipartite $K_{3,3}$

Graph homomorphism mathematical field of graph theory, a graph homomorphism is a mapping between two graphs that respects their structure. More concretely, it is a function between $V(G)$ and $V(H)$ such that if $(u, v) \in E(G)$ then $(f(u), f(v)) \in E(H)$

Petersen graph Petersen graph is "a remarkable configuration that serves as a counterexample to many optimistic predictions about what might be true for graphs in general"

Dense graph opposite, a graph with only a few edges, is a sparse graph. The distinction of what constitutes a dense or sparse graph is ill-defined, and is often represented ϵ

Graph (discrete mathematics) In discrete mathematics, particularly in graph theory, a graph is a structure consisting of a set of objects where some pairs of the objects are in some $R \subseteq V \times V$

Social graph A social graph is a graph that represents social relations between entities. It is a model or representation of a social network. The social graph has V nodes and E edges

Random graph mathematics, random graph is the general term to refer to probability distributions over graphs. Random graphs may be described simply by a probability distribution $\{p_{ij}\}$

Cubic graph of graph theory, a cubic graph is a graph in which all vertices have degree three. In other words, a cubic graph is a 3-regular graph. Cubic graphs are 2 -edge-connected

Graph coloring In graph theory, graph coloring is a methodic assignment of labels traditionally called "colors" to elements of a graph. The assignment is subject to C constraints

Graph theory graph theory is the study of graphs, which are mathematical structures used to model pairwise relations between objects. A graph in this context is made $G = (V, E)$
