== Peaks == Geography == The Saint Elias Mountains form the highest coastal mountain range on Earth. It formed due to the subduction of the Yakutat microplate underneath the North American Plate. The Yakutat microplate is a wedge shaped oceanic plateau with a thickness of 20 to 30 kilometres (12 to 19 mi). Similar to the adjacent Pacific Plate, which has a crustal thickness of 7 kilometres (4.3 mi), the Yakutat plate is moving northwestward at a rate of 50 millimetres (2 in) per year with... == Partial list of peaks == Formation == Mountain chains are typically formed by the process of plate tectonics. Tectonic plates slide very slowly over the Earth's mantle, a lower place of rock that is heated from the Earth's interior. Several huge sections of the Earth's crust are impelled by heat currents in the mantle, producing tremendous forces that can buckle the material at the edges of the plates to form mountains. Usually one plate is forced underneath the other, and the lower plate is slowly absorbed by the mantle. Where the two plates pass one another, heated rock from the mantle can burst through the crust to form volcanoes. The...

Appalachian Mountains It is geologically related to the Scottish Highlands, Atlas Mountains, Scandinavian Mountains, and Ouachitas, as these ranges all originally belonged to the sprawling Central Pangean Mountains before plate tectonics tore them apart. Alongside the Appalachian Plateau province—with which they are not entirely synonymous—the mountains form a wider system comprising the region's backbone. and Notre Dame Mountain ranges in Quebec, the higher summits rise above 4,000 ft (1,200 m) in elevation. Saint Pierre and Miquelon, an overseas collectivity of France, is part of the range, meaning it technically spans portions of three countries.
