

Losing Weight During Pregnancy

The very early stages of embryonic development are the same in all mammals, but later stages of development, and the length of gestation varies.

Morning sickness About 10% of women still have symptoms after the 20th week of pregnancy. Despite the name, nausea or vomiting can occur at any time during the day. Typically the Morning sickness, also called nausea and vomiting of pregnancy (NVP), is a symptom of pregnancy. Typically the symptoms occur between the 4th and 16th weeks of pregnancy. Despite the name, nausea or vomiting can occur at any time during the day. A severe form of the condition is known as hyperemesis gravidarum and results in weight loss. nausea and vomiting of pregnancy (NVP), is a symptom of pregnancy

The exact causes of hyperemesis gravidarum are unknown. Risk factors include the first pregnancy, multiple pregnancy, obesity, prior or family history of HG, and trophoblastic disorder. A December 2023 study published in Nature indicated a link between HG and abnormally high levels of the hormone GDF15, as well as increased sensitivity to that specific hormone. The definition of teenage pregnancy includes those who are legally considered adults in their country. The World Health Organization defines adolescence as the period between the ages of 10 and 19 years. Pregnancy can occur with sexual intercourse after the start of ovulation, which can happen before the first menstrual period (menarche). In healthy, well-nourished girls, the first period usually takes place between the ages of 12 and 13. Conception usually occurs following vaginal intercourse, but can also occur through assisted reproductive technology procedures. A pregnancy may end in a live birth, a miscarriage, an induced abortion, or a stillbirth. Childbirth typically occurs around 40 weeks from the start of the last menstrual period (LMP), a span known as the gestational age; this is just over nine months. Counting by fertilization age, the length is about 38 weeks. Implantation occurs on average 8-9 days after fertilization. An embryo is the term for the developing offspring during the first seven weeks following implantation (i.e. ten weeks' gestational age), after which the term fetus is used until the birth of a baby. == Terminology == Diagnosis is usually made based on the observed signs and symptoms. HG has been technically defined as more than three episodes of vomiting per day, such that weight loss of 5% or three kilograms has occurred and ketones are present in the urine. Other potential causes of the symptoms should be excluded, including urinary tract infection, and an overactive thyroid.

Prenatal development The term "prenate" is used to describe an unborn offspring at any stage of gestation. pounds during pregnancy are at increased risk for having a preterm or low birth weight infant. Iron and iodine are especially important during prenatal Prenatal development (from Latin natalis 'relating to birth') involves the development of the embryo and of the fetus during a viviparous animal's gestation. Prenatal development starts with fertilization, in the germinal stage of embryonic development, and continues in fetal development until birth

The risks of both neonatal HIV... Morning sickness affects about 70-80% of all pregnant women to some extent. About 60% of women experience vomiting. Hyperemesis gravidarum occurs in about 1.6% of pregnancies. Morning sickness can negatively affect quality of life, result in decreased ability to work while pregnant, and result in health-care expenses. Generally, mild to moderate cases have no effect on the fetus, and most severe cases also have normal... The cause of morning sickness is unknown but may relate to changing levels of the hormone human chorionic gonadotropin. Some have proposed that morning sickness may be useful from an evolutionary point of view. Diagnosis should only occur after other possible causes have been ruled out. Abdominal pain, fever, or headaches are typically not present in morning sickness. Because of the associated risks, people are advised not to smoke before, during or after pregnancy. If this is not possible, however, reducing the daily number of cigarettes smoked can minimize the risks for both the mother and child. This is especially true for people in developing countries, where breastfeeding is essential for the child's overall nutritional status. Treatment includes drinking fluids and a bland diet. Recommendations may include electrolyte-replacement drinks, thiamine, and a higher... Pregnant teenagers face many of the same pregnancy-related issues as older women. Teenagers are more likely to experience pregnancy complications or maternal death than women older than 19. There are additional concerns for those under the age of 15 as they are less likely to be physically developed to sustain a healthy pregnancy or to give birth. For girls aged 15-19, risks are associated more with socioeconomic factors than with the biological effects of age. Risks of low birth weight, premature labor, anemia, and pre-eclampsia are not connected to biological age by the time a girl is aged 16, as they are not observed in births to older... In 2014 report, the burden of the HIV/AIDS pandemic, including mother-to-child transmission of HIV, disproportionately affects low- and middle-income countries, in particular the countries of Southern Africa. The World Health Organization (WHO) estimates that 1.3 million women and girls living with HIV become pregnant each year. Pregnancy is divided into three trimesters of approximately... Treatment depends on the underlying cause. Emergent management is indicated for patients with significant blood loss or hemodynamic instability. Anti-D immune globulin is usually recommended in those who are Rh-negative. Early pregnancy loss can be treated with expectant management, medication, or surgical intervention. Ectopic pregnancy can be treated with medication or surgical management, although emergent intervention is...

Pregnancy A multiple pregnancy involves more than one offspring, such as with twins. A multiple pregnancy involves more than one offspring, such Pregnancy is the time during which one or more offspring gestates inside a woman's uterus. Pregnancy is the time during which one or more offspring gestates inside a woman's uterus

== Smoking before pregnancy ==

HIV and pregnancy There is a risk of HIV transmission from mother to child in three primary situations: pregnancy, childbirth, and while breastfeeding. HIV in pregnancy is the presence of an HIV/AIDS infection in a woman while she is pregnant. This is exemplified by data from The Centers for Disease Control (CDC): In the United States and Puerto Rico

between the years of 2014–2017, where prenatal care is generally accessible, there were 10,257 infants in the United States and Puerto Rico who were exposed to a maternal HIV infection in utero who did not become infected and 244 exposed infants who did become infected. This topic is important because the risk of viral transmission can be significantly reduced with appropriate medical intervention, and without treatment HIV/AIDS can cause significant illness and death in both the mother and child. There is a risk of HIV transmission from mother to child in HIV in pregnancy is the presence of an HIV/AIDS infection in a woman while she is pregnant 5133851b90

Hyperemesis gravidarum Hyperemesis gravidarum (HG) is a pregnancy complication that is characterized by severe nausea, vomiting, weight loss, and possibly dehydration. Feeling faint may also occur. Feeling Hyperemesis gravidarum (HG) is a pregnancy complication that is characterized by severe nausea, vomiting, weight loss, and possibly dehydration. Symptoms often get better after the 20th week of pregnancy but may last the entire pregnancy duration. It is considered a more severe form of morning sickness 5133851b90

A common saying that a woman "is eating for two" while pregnant implies that a mother should consume twice as much during pregnancy, but is misleading. Although maternal consumption will directly affect both herself and the growing fetus, overeating excessively will compromise the baby's health as the infant will have to work extra hard to become healthy in the future. Compared with the infant, the mother possesses the least biological risk. Therefore, excessive calories, rather than going to the infant, often get... 5133851b90

Early pregnancy bleeding Early pregnancy bleeding (also called first trimester bleeding) is vaginal bleeding before 13 weeks of gestational age. However, 50% of pregnancies with first trimester bleeding end in miscarriage. Early pregnancy bleeding is common and can occur in up to 25% of pregnancies. Many individuals with first trimester bleeding experience no additional complications. Early pregnancy bleeding is common Early pregnancy bleeding (also called first trimester bleeding) is vaginal bleeding before 13 weeks of gestational age 5133851b90

Women who are pregnant or planning to become pregnant are advised to stop smoking. It is important to examine these effects because smoking before, during and after pregnancy is not an unusual behavior among the general population and can have detrimental health impacts, especially among both mother and child, as a result. 5133851b90 Common causes of early pregnancy bleeding include miscarriage, ectopic pregnancy, and subchorionic hematomas. Other causes include implantation bleeding, gestational trophoblastic disease, cervical changes, or infections. Assessment of first trimester bleeding includes history and physical exam (including speculum examination), imaging using ultrasound, and lab work such as beta-hCG and ABO/Rh blood tests. 5133851b90 Signs and symptoms of early pregnancy may include missed periods, tender breasts, morning sickness (nausea and vomiting), hunger, implantation bleeding, and frequent urination. Pregnancy may be confirmed with a pregnancy test. Methods of contraception are used to avoid pregnancy. 5133851b90

Prenatal nutrition This is a rather critical time for healthy development since infants rely heavily on maternal stores and nutrients for optimal growth and health outcome later in life. Nutrition and weight management before and during pregnancy has a profound effect on the development Prenatal nutrition addresses nutrient recommendations before and during pregnancy. nutrient recommendations before and during pregnancy. Nutrition and weight management before and during pregnancy has a profound effect on the development of infants 5133851b90

Teenage pregnancy Inadequate nutrition during pregnancy is an even Teenage pregnancy, also known as adolescent pregnancy, is pregnancy in a female between the ages of adolescence. attempts to lose weight through dieting, skipping meals, food faddism, snacking, and consumption of fast food 5133851b90

== Effects on the fetus == 5133851b90 According to a 1999 meta-analysis published in the American Journal of Preventive Medicine, smoking prior to pregnancy... 5133851b90

Parental obesity recommended that obese women should try to lose weight before becoming pregnant, yet women should not diet during pregnancy because sufficient nutrition is important Maternal obesity refers to obesity (often including being overweight) of a woman during pregnancy. Parental obesity refers to obesity of either parent during pregnancy 5133851b90

Obesity is defined as having a Body Mass Index (BMI) of 30 or greater. A 5-foot-5-inch tall woman would be considered obese if she weighs 180 pounds or more and a 5-foot-8-inch tall woman would be considered obese if she weighs 200 pounds or more. About one third of women of the reproductive ages are overweight with a BMI greater than or equal to twenty-five. 5133851b90 In human pregnancy, prenatal development is also called antenatal development. The development of the human embryo follows fertilization, and continues as fetal development. By the end of the tenth week of gestational age, the embryo has acquired its basic form and is referred to as a fetus. The next period is that of fetal development where many organs become fully developed. This fetal period is described both topically (by organ) and chronologically (by time) with major occurrences being listed by gestational age. 5133851b90

Smoking and pregnancy A number Tobacco smoking during pregnancy causes many detrimental effects on health and reproduction, in addition to the general health effects of tobacco. A number of studies have shown that tobacco use is a significant factor in infertility and miscarriages among pregnant smokers, and that it contributes to a number of other threats to the health of the foetus. Tobacco smoking during pregnancy causes many detrimental effects on health and reproduction, in addition to the general health effects of tobacco 5133851b90

Prenatal nutrition has a strong influence on birth weight and further development of the infant. A study at the National Institution of Health found that babies born from an obese mother have a higher probability to fail tests of fine motor skills which is the movement of small muscles such as the hands and fingers. 5133851b90 Maternal obesity significantly affects maternal metabolism and offspring development. It disrupts insulin resistance, glucose homeostasis, fat

oxidation, and amino acid synthesis, contributing to adverse outcomes. Lifestyle modification is an effective strategy to improve maternal metabolism and prevent complications. 5133851b90
