Charles Darwin, for example, was reported to have disavowed his theory of evolution in favor of traditional religious faith at his death. This widely disseminated report served the interests of those who opposed Darwin's theory on religious grounds. However, the putative witness had not been at Darwin's deathbed or seen him at any time near the end of his life. e8e290ccaf

pathological condition commonly seen in sports medicine in which the human heart is enlarged, and the resting heart rate is lower than normal. arrhythmia. The pulse of a person with athlete's heart can sometimes be irregular while at rest, but usually returns to normal after exercise begins

He completed his residency in internal medicine in 1988 at New York University Medical Center. == Signs and symptoms == Athlete's heart is associated with physiological cardiac remodeling as a consequence of repetitive cardiac loading. Athlete's heart is common in athletes who routinely exercise more than an hour a day, and occurs primarily in endurance athletes, though it can occasionally arise in heavy weight trainers. The condition is generally considered benign, but may occasionally hide a serious medical condition, or may even be mistaken for one.

High-intensity interval training The very high level of intensity, the interval duration, and number of bouts distinguish it from aerobic (cardiovascular) activity, because the body significantly recruits anaerobic energy systems (although not completely to the exclusion of aerobic pathways). The number of

High-intensity interval training (HIIT) is a training protocol alternating short periods of intense or explosive anaerobic exercise with brief recovery periods until the point of exhaustion. The method thereby relies on "the anaerobic energy releasing system almost maximally". HIIT involves exercises performed in repeated quick bursts at maximum or near maximal effort with periods of rest or low activity between bouts. The medium exercise should be about 50% intensity. cool-down period. The high-intensity exercise should be done at near maximum intensity

Following high school, he attended Brown University in Providence, Rhode Island, from 1974 to 1978. He received his Doctor of Medicine degree in 1985 from the State University of New York at Buffalo. == Early life and education ==

List of last words recantations) and "I have sinned, in that I have signed with my hand what I did not believe with my heart. Reasons can include simple error or deliberate intent. attitudes toward death at the time. (People dying of illness are frequently inarticulate at the end, and in such cases their actual last utterances may not be recorded or considered very important.) Last words may be recorded accurately, or, for a variety of reasons, may not. When the flames are lit, this hand shall be the first A person's last words, their final articulated words stated prior to death or as death approaches, are often recorded because of the decedent's fame, but sometimes because of interest in the statement itself e8e290ccaf

Early warning scores have been proposed that combine the individual values of vital signs into a single score. This was done in recognition that deteriorating vital signs often precede cardiac arrest and/or admission to the intensive care unit. Used appropriately, a rapid response team can assess and treat a deteriorating patient and prevent adverse outcomes. e8e290ccaf

Although there are varying forms of HIIT-style workouts which may involve exercises associated with both cardiovascular activity and also resistance training, HIIT's crucial features of maximal effort, duration, and short rest periods (thereby triggering the anaerobic pathways of energy production) materially differentiate it from being considered a form of cardiovascular exercise. Though there is no universal HIIT session duration, a HIIT workout typically lasts under 30 minutes in total as it uses the anaerobic... Primary vital signs
