

Snake About To Bite

The estimated incidence of snakebites annually in Australia is between 3 and 18 per 100,000 with an average mortality rate of 0.03 per 100,000 per year, or roughly 1 to 2 persons... Accounts differ widely on how to make and use a 'black stone'. The United States has about 30 species of venomous snakes, which include 23 species of rattlesnakes, three species of coral snakes, and four species of American moccasins. At least one species of venomous snake is found in every state except Hawaii, Maine, and Alaska. 13th century Persian/Iranian writer Kazwini describes the snake-stone in his work *Aja'ib al-Makhlukat* as being the size of a small nut. The quote about how the cure goes is as follows "An injury inflicted by a venomous creature is to be immersed in warm water or sour milk. The snake-stone is then dropped into the liquid to supposedly draw out the poison."

Recording The two extensively recognized species of this genus are *Notechis scutatus* (Peters, 1861) and *Notechis ater* (Krefft, 1866), which show further variety in their... == Snake species == While tiger snakes are usually ground-dwelling, they are able to swim as well as climb into trees and buildings. There is a Diogenes club in a building where people have to remain quiet or otherwise, they might get kicked out. Amyus Crowe and Mycroft Holmes arrive in the building and then they find out that Sherlock has been kidnapped into a ship called *Gloria Scott* by the Paradol Chamber. There, Sherlock Holmes is like a worker who cleans the ship. He meets a friend, Wu Chung, who is the cook. There, he learns to cook, and tai chi which was vital when pirates invaded the ship. The ship was on its way to Shanghai, China and later on, it would return to England. He also befriended the Mackenzies and Jacobus Arrhenius. The Mackenzies consisted of Cameron Mackenzie, his father Malcolm Mackenzie, and Mrs. Mackenzie. In Arrhenius cabin, he spotted a bag. Then, all of them... Although Australian snakes can be very venomous, comparatively little is known about the protein compositions of venoms from Australian snakes, compared to those of Asia and America. Wide access to antivenom and adequate medical care has made deaths exceedingly rare with only a few fatalities each year. Australian snakes possess potent venom; 10 of the world's top 10 most venomous snakes live in Australia. == Summary == Venom contains more than 20 different compounds, which are mostly proteins and polypeptides. The complex mixture of proteins, enzymes, and various other substances has toxic and lethal properties. Venom serves to immobilize prey. Enzymes in venom play an important role in the digestion of prey, and various other substances are responsible for important but non-lethal

biological effects. Some of the proteins in snake venom have very specific effects on various biological functions, including blood coagulation, blood pressure regulation,... eb8aa6b6aa The genus *Notechis* is in the elapid family, venomous snakes with fixed front fangs. The classification of this genus is given as a single and highly variable species, *Notechis scutatus*, or a second species *Notechis ater*, and by an arrangement of subspecies or regional morphs. eb8aa6b6aa

List of fatal snake bites in Australia Omitted incidents include cases where someone died from falling after receiving a bite. Some of the comments include the first aid or treatment that was attempted. remember is to never attempt to catch or kill a snake – most snake bites occur when people are trying to do this. " Snakes of Australia Epidemiology of Below is a list of fatal snakebites that occurred in Australia. Current practice advises not washing the affected body part so that medical personnel can sample venom residue on the skin to determine which type of snake was involved. For the older fatalities, the term ligature meant wrapping a limb or finger with a string to act like a tourniquet, and the term scarify meant cutting the skin so blood flows out of the body, presumably to flush venom eb8aa6b6aa

The World Health Organization states that it has no effect on snake-bites, bearing in mind that most snake-bites are from non-venomous snakes. They state that traditional medicines and other treatments such as wound incision or excision, suction, or application of "black stones" should be avoided. eb8aa6b6aa == Evolution == eb8aa6b6aa

Snake Closely related to lizards and the tuatara, snakes are ectothermic, amniote, air-breathing vertebrates with an elongated rope-like body covered by overlapping scales, and they move around using undulatory, rectilinear, concertina, sidewinding or slide-pushing locomotions, with some arboreal species even capable of short-ranged gliding flight by flaring out the ribs to flatten and widen the body for aerodynamic lift. To accommodate their narrow bodies, snakes' paired organs (such as kidneys) appear one in front of the other instead of side by side, and most only have one functional lung. Snakes have skulls with significantly fewer sutures and more hypermobile articulations (i. Despite being tetrapods from a cladistic prospective, snakes lack limbs completely, although pythons and boids retain a vestigial pelvic girdle. Snakes are limbless reptiles of the squamate suborder Serpentes. cranial kinesis) than their lizard relatives, enabling them to greatly widen the mouth and swallow prey much larger than their heads. e. Some lizards have also independently evolved a snake-like elongated body without limbs or with greatly reduced limbs at least twenty-five times via convergent evolution, eb8aa6b6aa

The outcome depends on the type of snake, the area of the body bitten, the amount of snake venom injected, the general health of the person bitten, and whether or not anti-venom serum has been administered in a timely manner. Problems are often more severe in children than adults, due to their smaller size. Allergic reactions to snake venom can further complicate outcomes and can include anaphylaxis, requiring additional treatment and

Venomous snake Other important factors for risk assessment include the likelihood that a snake will bite, the quantity of venom delivered with the bite, the efficiency of the delivery mechanism, and the location of a bite on the body of the victim. The venom is typically delivered by injection using hollow or grooved fangs, although some venomous snakes lack well-developed fangs. The toxicity of venom is mainly indicated by murine LD50, while multiple factors are considered to judge the potential danger to humans. Snake venom may have both neurotoxic and hemotoxic properties. Roughly 7,000-8,000 people are bitten by venomous snakes each year in the United States, and about five of those people die. Though most fatal bites are attributed to rattlesnakes, the copperhead accounts for more snakebites than any other venomous North American species. Rattlesnake bites are roughly four times as likely to result in serious injury or death as a copperhead bite. eb8aa6b6aa == Taxonomy == eb8aa6b6aa

Snakebite snakebite is an injury caused by the bite of a snake, especially a venomous snake. Most bites are on the hands, arms, or legs. This may result in redness, swelling, and severe pain at the area, which may take up to an hour to appear. Bites may result in the loss of a limb or other chronic problems or even death. The venom may cause bleeding, kidney failure, a severe allergic reaction, tissue death around the bite, or breathing problems. Vomiting, blurred vision, tingling of the limbs, and sweating may result. A common sign of a bite from a venomous snake is the presence of two puncture wounds from the animal's fangs. Tiger snake Tiger snakes use venom to kill prey, and may also bite an aggressor; they are potentially fatal to humans. underside of the snake is light yellow or orange. All populations are classified within the genus *Notechis* (Elapidae). Tolerant The tiger snake (*Notechis scutatus*) is a large and highly venomous snake of southern Australia, including its coastal islands and Tasmania. These snakes are often observed and locally well known by their banding, black and yellow like a tiger, although the species can be highly variable in colouration and patterning. Their diverse characteristics have been classified either as distinct species or by subspecies and regional variation eb8aa6b6aa

The venom glands that secrete zootoxins are a modification of the parotid salivary glands found in other vertebrates and are usually located on each side of the head, below and behind the eye, and enclosed in a muscular sheath. The venom is stored in large glands called alveoli before being conveyed by a duct to the base of channeled or tubular fangs through which it is ejected. eb8aa6b6aa == Descriptions == eb8aa6b6aa
