Depletion of hydrogen peroxide (H2O2)-producing Lactobacillus strains such as Lactobacillus crispatus in the vagina has been strongly associated with BV and UTIs. Most commercially available probiotic Lactobacillus strains are not vaginal strains and do not appear to improve vaginal or urinary health outcomes. The Centers for Disease Control and Prevention (CDC)'s Sexually Transmitted Infections Treatment Guidelines (2021) noted that intravaginal LACTIN-V produced a considerably lower recurrence of BV following initial antibiotic treatment with metronidazole in a randomized controlled trial. However, the guidelines also noted that LACTIN-V is not yet Food and Drug Administration (FDA)-approved or commercially available. 04c0e94a7d == Pathogenic properties == 04c0e94a7d == General determinants == 04c0e94a7d The clinician should also look for physical findings of fever, rash, direct tenderness over the bladder area, and joint pain. Physical findings of increased temperature, increased pulse, low blood pressure in the presence of dysuria can indicate systemic infection. Urological obstruction due to stone or tumor can result in findings of hematuria, decreased urination, and bladder spasms. All these physical findings should be looked for carefully while obtaining history. History regarding recent sexual activity is crucial. 04c0e94a7d

Genitourinary microbiome have implications for patients with urinary tract infections (UTIs), sexually transmitted infections (STIs), interstitial cystitis and chronic prostatitis The genitourinary microbiome refers to the aggregate of bacteria, archaea, and fungi that may colonize the human genital and urinary tract. Some analyses also include any viruses and protists present. This term encompasses both the human urinary microbiome (urobiome), as well as the genital microbiome, and is a subset of the human microbiome 04c0e94a7d

Susceptibility and severity of infections in pregnancy risk. Listeriosis is a vertically transmitted infection that may cause miscarriage, stillbirth, preterm birth, or serious neonatal disease. Some infections Pregnancy is regulated by a network of interrelated physiological and cellular processes that support maternal homeostasis, preserve an optimal maternal-fetal interface, and enhance fetal development. In pregnancy, there is an increased susceptibility and/or severity of several infectious diseases, due to physiological and immunological changes 04c0e94a7d

Circumcision It may be medically necessary in cases of phimosis, chronic urinary tract infections (UTIs), and other pathologies of the penis that do not resolve with other treatments. Topical or locally injected anesthesia is generally used to reduce pain and physiologic stress. In the procedure's most common form, the foreskin is extended with forceps, then a circumcision device may be placed, after which the foreskin is excised. Circumcision is undertaken for religious, cultural, social, and medical reasons. The procedure is contraindicated in cases of certain genital structure abnormalities or poor general health. The procedure is contraindicated in cases Circumcision is a surgical procedure that removes the foreskin from the human penis. urinary tract infections (UTIs), and other pathologies of the penis that do not resolve with other treatments 04c0e94a7d

Enterococcus faecium This Enterococcus faecium is a Gram-positive, gamma-hemolytic or non-hemolytic bacterium in the genus Enterococcus. may also be pathogenic, causing diseases such as neonatal meningitis or endocarditis. faecium is often referred to as VRE. It can be commensal (innocuous, coexisting organism) in the gastrointestinal tract of humans and animals, but it may also be pathogenic, causing diseases such as neonatal meningitis or endocarditis. In 2024, Planned Parenthood Direct expanded services to deliver medication abortion pills directly to patients in some states. Patient requests for medication abortion pills are provided to up to 10 weeks into pregnancy, and require a Planned Parenthood health... 04c0e94a7d The most common cause of infection is E. coli, though other bacteria or fungi may sometimes be the cause. Risk factors include being female, sexual intercourse, diabetes, using a catheter, and family history. Additional factors that have been found to increase the risk of infection include urinary retention (delaying urination), insufficient water intake, use of spermicides as a contraceptive method, and poor genital hygiene. 04c0e94a7d == History == 04c0e94a7d == Diagnosis == 04c0e94a7d By producing the enterocins A, B, and P (genus-specific bacteriocins), Enterococcus faecium can combat pathogenic gut microbes, such as Escherichia coli, reducing gastrointestinal disease in hosts. As an alternative to adding antibiotics to livestock... 04c0e94a7d Planned Parenthood Direct initiated services in 2015, when it launched the Planned Parenthood Direct app in California. At that time, the app's functionality focused on testing for sexually transmitted diseases (STDs). Testing kits are mailed directly to patients homes, then the patient sends the kit back, and the results are conveyed to the patient via the app. 04c0e94a7d This bacterium has developed multi-drug antibiotic resistance and uses colonization and secreted factors in virulence (enzymes capable of breaking down fibrin, protein, and carbohydrates to regulate adherence of bacteria to inhibit competitive bacteria). The enterococcal surface protein (Esp) allows the bacteria to aggregate and form biofilms. Additional virulence factors include aggregation substance (AS), cytosolin, and gelatinase. AS allows the microbe to bind to target cells, and it facilitates the transfer of genetic material between cells. 04c0e94a7d == Research == 04c0e94a7d It is one of a constellation of irritative bladder symptoms (also sometimes referred to as lower urinary tract symptoms), which includes nocturia and urinary frequency. 04c0e94a7d There is now evidence to support colonization of the female bladder as well as the male lower urinary tract. The significance of the

genitourinary microbiome on disease incidence or progression is not yet understood. Perturbations in the genitourinary microbiome... 04c0e94a7d By 2019, Planned Parenthood Direct was providing services in 27 states and Washington DC. The services focused on delivering birth control pills, and providing care for urinary tract infections (UTI). In September 2019, in response to government plans to reduce healthcare funding to Planned Parenthood, Planned Parenthood Direct created expansion plans to reach all fifty states.

04c0e94a7d The procedure is associated with reduced rates of urinary tract infections and sexually transmitted infections including incidence of cancer-causing forms of human papillomavirus (HPV), and is known to reduce HIV transmission among heterosexual men in high-risk populations by up to 60%; its prophylactic efficacy against HIV transmission in the developed world or among men who have sex with men is debated. Neonatal circumcision decreases the risk of penile cancer. Complication rates increase significantly... 04c0e94a7d

Dysuria It can be caused by various conditions, such as urinary tract infections. Pyelonephritis Sexually transmitted disease Trichomoniasis Urethral stricture Urethritis Urinary schistosomiasis Urinary tract infection (UTI) caused by bacterial Dysuria is a painful or otherwise uncomfortable sensation in the urethra associated with urination 04c0e94a7d

Planned Parenthood Direct It is published by a healthcare corporation of the same name. that time, the app's functionality focused on testing for sexually transmitted diseases (STDs). Testing kits are mailed directly to patients homes, then Planned Parenthood Direct is mobile app that provides reproductive health services using a telehealth model 04c0e94a7d

LACTIN-V crispatus) which is under development for the treatment of urinary tract infections (UTIs) and bacterial vaginosis (BV). It is administered intravaginally and is described as the first vaginal microbiome (VMB)-based live biotherapeutic product (LBP). for Disease Control and Prevention (CDC)'s Sexually Transmitted Infections Treatment Guidelines (2021) noted that intravaginal LACTIN-V produced a considerably LACTIN-V, also known as CTV-05 or as Lactobacillus crispatus CTV-05, is a live biopharmaceutical medication containing a strain of Lactobacillus crispatus (L 04c0e94a7d

The study of the genitourinary microbiome is young; only the vaginal microbiome has been thoroughly characterized. The development of next-generation sequencing has allowed researchers to use 16S ribosomal RNA to identify organisms present in asymptomatic or "healthy" individuals. 04c0e94a7d As of December 2021, LACTIN-V is in phase 2/3 clinical trials... 04c0e94a7d Vancomycin-resistant E. faecium is often referred to as VRE. 04c0e94a7d There are several potential risk factors or causes to this increased risk: 04c0e94a7d

Urinary tract infection Symptoms from a lower UTI include burning or pain during urination, pain in the lower abdomen and the urge to urinate even when the bladder is empty. Symptoms of a kidney infection are more systemic and include fever or flank pain, usually in addition to the symptoms of a lower UTI. A urinary tract infection (UTI) is an infection that affects a part of the urinary tract, which includes the bladder, urethra and the kidney. Lower UTIs A urinary tract infection (UTI) is an infection that affects a part of the urinary tract, which includes the bladder, urethra and the kidney. Symptoms may be less clear in very young or old people. Lower UTIs affect the bladder (cystitis) or urethra while upper UTIs affect the kidney (pyelonephritis). Rarely, the urine may appear bloody 04c0e94a7d

Opportunistic infection to diseases beyond the gut, notably urinary tract infections (UTIs), meningitis, and bacteremia (bloodstream infections). Haemophilus influenzae is a bacterium 04c0e94a7d

Urinalysis is the most useful test to start the work up in a patient of dysuria. Urinalysis positive for nitrite carries a high predictive value of a positive urine culture. Also, urine dipstick showing leukocytes as equal predictive value as the presence of nitrites. When both are present, the predictive value goes... 04c0e94a7d

Studies of the human microbiome traditionally lack in discussion of the genitourinary system due to the long-standing misnomer that urine that does not grow colony-forming units (CFUs) in standard microbiological cultures is "sterile". This has stunted research on microbiomes of the bladder or urethra. 04c0e94a7d Kidney infections usually occurs when a bladder infection spreads, but may also come from bacteria in the blood. Diagnosis in young healthy women can... 04c0e94a7d
