Perimenopausal Estrogen Replacement Therapy Study (PERT) 07b0321256

Growth hormone GH is a 191-amino acid, single-chain polypeptide that is synthesized, stored and secreted by somatotrophic cells within the lateral wings of the anterior pituitary gland. GH also stimulates production of insulin-like growth factor 1 (IGF-1) and increases the concentration of glucose and free fatty acid. It is a type of mitogen which is specific only to the receptors on certain types of cells. Growth hormone (GH) or somatotropin, also known as human growth hormone (hGH or HGH) in its human form, is a peptide hormone that stimulates growth, cell Growth hormone (GH) or somatotropin, also known as human growth hormone (hGH or HGH) in its human form, is a peptide hormone that stimulates growth, cell reproduction, and cell regeneration in humans and other animals. It is thus central to human development 07b0321256

hormonal cycle using rhythmic doses of hormones standardized to a uniform purity. S 07b0321256

Eligibility for GAHT may require an assessment for gender dysphoria or persistent gender incongruence; many medical institutions now use an informed consent model, which ensures patients are informed of the procedure process, including possible benefits and risks, while removing many of the historical barriers needed to start hormone therapy. Treatment guidelines for therapy have been developed by several medical associations... 07b0321256 The purpose of the therapy is to cause the development of the secondary sex characteristics of the desired sex, such as breasts and a feminine pattern of hair, fat, and muscle distribution. It cannot undo many of the changes produced by naturally occurring puberty, which may necessitate surgery and other treatments to reverse (see below). The medications used for feminizing hormone therapy include estrogens, antiandrogens, progestogens, and gonadotropin-releasing hormone modulators (GnRH modulators). 07b0321256 Clinical Study on Hormone Dose Optimisation in Climacteric Symptoms Evaluation (CHOICE) 07b0321256 The long-term... 07b0321256

Feminizing hormone therapy It is a common type of transgender hormone therapy (another being masculinizing hormone therapy) and is used to treat transgender women and non-binary transfeminine individuals. Some, in particular intersex people, but also some non-transgender people, take this form of therapy according to their personal needs and preferences. Feminizing hormone therapy, also known as transfeminine hormone therapy, is a form of gender-affirming care and a gender-affirming hormone therapy to change Feminizing hormone therapy, also known as transfeminine hormone therapy, is a form of gender-affirming care and a gender-affirming hormone therapy to change the primary and secondary sex characteristics of transgender people from masculine to feminine 07b0321256

Masculinizing hormone therapy is a form of transgender hormone therapy which develops male secondary sex characteristics and suppresses or minimizes female ones. This can alleviate gender dysphoria, and help individuals be correctly perceived as their respective gender ("passing"). It is used by trans men and transmasculine individuals as part of gender transition, to align their body with their gender identity 07b0321256

Growth hormone therapy In the past, growth hormone was extracted from human pituitary glands. Growth hormone therapy refers to the use of growth hormone (GH) as a prescription medication—it is one form of hormone therapy. Growth hormone is a peptide Growth hormone therapy refers to the use of growth hormone (GH) as a prescription medication—it is one form of hormone therapy. Growth hormone is a peptide hormone secreted by the pituitary gland that stimulates growth and cell reproduction. GH therapy has been a focus of social and ethical controversies for 50 years. Growth hormone is now produced by recombinant DNA technology and is prescribed for a variety of reasons 07b0321256

High-dose estrogen therapy When given in combination with a high dose of High-dose estrogen therapy (HDE) is a type of hormone therapy in which high doses of estrogens are given. It is called

Is Hormone Replacement Therapy Safe

this because the estrogen and progestogen levels achieved are in the range of the very high levels of these hormones that occur during pregnancy. Both natural or bioidentical estrogens and synthetic estrogens have been used and both oral and parenteral routes may be used. HDE and pseudopregnancy have been used in medicine for a number of hormone-dependent indications, such as breast cancer, prostate cancer, and endometriosis, among others. High-dose estrogen therapy (HDE) is a type of hormone therapy in which high doses of estrogens are given. When given in combination with a high dose of progestogen, it has been referred to as pseudopregnancy
07b0321256

HDE and/or pseudopregnancy have been used in clinical medicine for the following indications:
07b0321256 == Medical uses == 07b0321256 This article describes the history of GH treatment and the current uses and risks arising from GH use. Other articles describe GH physiology, diseases of GH excess (acromegaly and pituitary gigantism), deficiency, the recent phenomenon of HGH controversies, growth hormone in sports, and growth hormone for cows. 07b0321256

Gender-affirming hormone therapy This form of hormone therapy is given as one of two types, based on whether the goal of treatment is masculinization or feminization:. Gender-affirming hormone therapy (GAHT), also known as hormone replacement therapy (HRT) or transgender hormone therapy, is a form of hormone therapy in which Gender-affirming hormone therapy (GAHT), also known as hormone replacement therapy (HRT) or transgender hormone therapy, is a form of hormone therapy in which sex hormones and other hormonal medications are administered to transgender or gender nonconforming individuals for the purpose of more closely aligning their secondary sexual characteristics with their gender identity 07b0321256

Stockholm Trial or Stockholm Randomized Trial 07b0321256 Masculinizing hormone therapy

involves taking testosterone, the primary male sex hormone. This causes many of the same bodily changes seen in male puberty, including deeper vocal pitch, greater facial and body hair, heightened sex drive, muscle growth, fat redistribution, and enhanced size and sensitivity of the clitoris ("bottom growth"). It stops menstruation, and reduces production of estrogen, the primary female sex hormone. It cannot reverse breast development, which may necessitate chest reconstruction ("top surgery"). 07b0321256 Women... 07b0321256

Hormone replacement therapy g. Effects of menopause can include symptoms such as hot flashes, accelerated skin aging, vaginal dryness, decreased muscle mass, and complications such as osteoporosis (bone loss), sexual dysfunction, and vaginal atrophy. estrogens) that occur during menopause. They are mostly caused by low levels of female sex hormones (e. Hormone replacement therapy (HRT), also known as menopausal hormone therapy or postmenopausal hormone therapy, is a form of hormone therapy used to treat Hormone replacement therapy (HRT), also known as menopausal hormone therapy or postmenopausal hormone therapy, is a form of hormone therapy used to treat symptoms associated with female menopause 07b0321256

Bioidentical hormone replacement therapy Bioidentical hormone replacement therapy (BHRT), also known as bioidentical hormone therapy (BHT) or natural hormone therapy, is the use of hormones that are Bioidentical hormone replacement therapy (BHRT), also known as bioidentical hormone therapy (BHT) or natural hormone therapy, is the use of hormones that are identical on a molecular level with endogenous hormones in hormone replacement therapy. A number of claims by some proponents of BHT have not been confirmed through scientific testing. Specific hormones used in BHT include estrone, estradiol, progesterone, testosterone, dehydroepiandrosterone (DHEA), and estriol. It may also be combined with blood and saliva testing of hormone levels, and the use of pharmacy compounding to obtain hormones in an effort to reach a targeted level of hormones in the

Papworth HRT Atherosclerosis Study (PHASE) 07b0321256 Masculinizing hormone therapy - for transgender men or transmasculine people; consists of androgens and occasionally antiestrogens. 07b0321256 The protocol has been criticized by members of the medical community for the dosages of the hormones used, side effects of the treatment, potential physiologic effects, Wiley's lack of medical or clinical qualifications to design the protocol, lack of empirical evidence demonstrating it as safe or effective, ethical problems with the clinical trial that is being run to test it and potential financial conflicts of interest regarding financial incentives. 07b0321256 Other medications used include GnRH agonists and antagonists to completely suppress estrogen and progesterone; progestins like medroxyprogesterone acetate to suppress menstruation; and 5 α -reductase inhibitors to prevent pattern hair loss. Sometimes another... 07b0321256 == Specific dosing == 07b0321256 Custom-compounded BHT is a practice almost wholly restricted to the United States and is a form of alternative medicine. It has been promoted as a panacea for many diseases and for relieving the symptoms of menopause beyond the medical objective of reducing the risk of osteoporosis. There is little evidence to support these incremental claims; the hormones are expected to have the same risks and benefits as comparable approved drugs for which there is evidence based on extensive research and regulation, except for progesterone, which... 07b0321256 Women's Estrogen Lipid-Lowering Hormone Atherosclerosis Regression Trial (WELL-HART) 07b0321256 Estrogens and progestogens are the main hormone drugs used in HRT. Progesterone is the main female sex hormone that occurs naturally and is also manufactured into a drug that is used in menopausal hormone therapy. Although both classes of hormones can have symptomatic benefit, progestogen is specifically added to estrogen regimens, unless the uterus has been removed, to avoid the increased risk of endometrial cancer. Unopposed estrogen therapy promotes endometrial hyperplasia and increases the risk of cancer, while progestogen reduces this risk. Androgens like testosterone are

Is Hormone Replacement Therapy Safe

sometimes used as well. HRT is available through a variety of different routes. 07b0321256 Feminizing hormone therapy - for transgender women or transfeminine people; consists of estrogens with or without antiandrogens. 07b0321256 Postmenopausal Estrogen/Progestin Interventions (PEPI) 07b0321256 Danish Osteoporosis Prevention Study (DOPS) (open-label) 07b0321256 Estrogen in Prevention of Atherosclerosis Trial (EPAT) 07b0321256 Estrogen in Venous Thromboembolism Trial (EVTET) 07b0321256 The Wiley Protocol uses bioidentical hormones, specifically estradiol and progesterone. Hormones are applied transdermally, using an oil-based skin cream for topical administration. Doses of the hormones vary throughout a 28-day cycle... 07b0321256 A recombinant form of HGH called somatropin (INN) is used as a prescription drug to treat children's growth disorders and adult growth hormone deficiency. In the United States, it is only available legally from pharmacies by prescription from a licensed health care provider. In recent years in the United States, some health care providers are prescribing growth hormone in the elderly to increase vitality. While legal, the efficacy and safety of this use for HGH has not been tested in a clinical trial. Many of the functions of HGH remain unknown... 07b0321256
