A number of vaccine combinations include the tetanus vaccine, such as DTaP and Tdap, which contain diphtheria, tetanus, and pertussis vaccines, and DT and Td, which contain diphtheria and tetanus vaccines. DTaP and DT are given to children less than seven years old, while Tdap and Td are given to those seven years old and older. Fever, feeling tired, and minor muscle pain occurs in less than 10% of people. Severe allergic reactions occur in fewer than one in 100,000 people. 8baf6f2d5e == Provisions == 8baf6f2d5e Common side effects include menstrual disturbances such as absence of periods, abdominal pain, and headaches. More serious side effects include bone loss, blood clots, allergic reactions, and liver problems. Use is not recommended during pregnancy as it may increase the risk of low birth weight. MPA is an artificial progestogen, and as such activates the progesterone receptor, the biological target of progesterone. It also has androgenic activity and weak glucocorticoid activity. Due to its progestogenic activity, MPA decreases the body's release of gonadotropins... 8baf6f2d5e

Epidural administration most common complications of epidural injections include bleeding problems, headaches, and inadequate pain control. The epidural route is used by physicians and nurse anesthetists to administer local anesthetic agents, analgesics, diagnostic medicines such as radiocontrast agents, and other medicines such as glucocorticoids. Epidural analgesia during childbirth Epidural administration (from Ancient Greek ἐπί, "upon" + dura mater) is a method of medication administration in which a medicine is injected into the epidural space around the spinal cord. Epidural administration involves the placement of a catheter into the epidural space, which may remain in place for the duration of the treatment. The technique of intentional epidural administration of medication was first described in 1921 by the Spanish Aragonese military surgeon Fidel Pagés 8baf6f2d5e

After three doses, almost everyone is initially immune, but additional doses every ten years are recommended to maintain immunity. A booster shot should be given within 48 hours of an injury to people whose immunization is out of date. 8baf6f2d5e

Medroxyprogesterone acetate The injectable form is used as a method of birth control and to treat endometriosis, and the tablet form is used as a part of menopausal hormone therapy or to treat abnormal uterine bleeding and certain types of cancers. It is also used to treat paraphilias. The injectable form is used as a method of birth control and to treat endometriosis, and the tablet form is used as a part of Medroxyprogesterone acetate (MPA), whose injectable form is known as depot medroxyprogesterone acetate (DMPA) and sold under the brand name Depo-Provera among others, is a hormonal medication of the progestin type. The medication is available both alone and in combination with an estrogen. medication of the progestin type. It may be taken by mouth, used under the tongue, or by injection into a muscle or fat 8baf6f2d5e

Epidural anaesthesia causes a loss of sensation, including pain, by blocking the transmission of signals through nerve fibres in or near the spinal cord. For this reason, epidurals are commonly used for pain control during childbirth and surgery, for which the technique is considered safe and effective, and is considered more effective and safer than giving pain medication by mouth or through an intravenous line. An epidural injection may also be used to administer steroids for the treatment of inflammatory... 8baf6f2d5e

Cum shot Cum shots may also depict ejaculation onto another part of the body, such as on the genitals, buttocks, chest or tongue. One critic of "cum shot" scenes in heterosexual pornography was the US porn A cum shot is the depiction of human ejaculation, especially onto another person. The term is usually applied to depictions occurring in pornographic films, photographs, and magazines. Treatment options include diphenhydramine and/or an injection of epinephrine. Facial cum shots (or "facials") are regularly portrayed in pornographic films and videos, often as a way to close a scene. Unlike ejaculation in non-pornographic sex, cum shots typically involve ejaculation outside the receiver's body, allowing the viewer to see the ejaculation in progress 8baf6f2d5e

Redness and pain at the site of injection occur in between 25% and 85% of people. During childhood, five doses are recommended, with a sixth given during adolescence 8baf6f2d5e

While many methods may prevent conception, only male and female condoms are effective in preventing sexually transmitted infections. 8baf6f2d5e The term is typically used by the cinematographer within the narrative framework of a pornographic film, and, since the 1970s, it has become a leitmotif of the hardcore genre. Two exceptions are softcore pornography, in which penetration is not explicitly shown, and "couples erotica", which may involve penetration but is typically filmed in a more discreet manner intended to be romantic or educational rather than graphic. Softcore pornography that does not contain ejaculation sequences is produced both to respond to a demand by some consumers for less-explicit pornographic material and to comply... 8baf6f2d5e

Comparison of birth control methods As the technology, education, and awareness about contraception has evolved, new contraception methods have been theorized and put in application. As the technology, education, and There are many methods of birth control (or contraception) that vary in requirements, side effects, and effectiveness. Outlined here are the different types of barrier methods, hormonal methods, various methods including spermicides, emergency contraceptives, and surgical methods and a comparison between them. Although no method of birth control is ideal for every user, some methods remain more effective, affordable or intrusive than others. == History == 8baf6f2d5e The vaccine is very safe, including during pregnancy and in those with HIV/AIDS. 8baf6f2d5e Various unsafe birth control methods were available throughout the 18th and 19th centuries. Effective and safe forms of birth control became available in the United States in the 20th century with advances in science that led to the advent of safe methods and various Supreme Court decisions, including *Griswold v. Connecticut* in 1965 and *Eisenstadt v. Baird* in 1972, that struck down "Comstock laws" that imposed government restrictions on contraceptives. 8baf6f2d5e The coagulation pathway helps the body

stop active bleeds by using vitamin K dependent clotting factors (factors II, VII, IX, and X) which are synthesized by the liver. Vitamin K can be delivered into the body via the oral, subcutaneous, intramuscular, or intravenous routes of administration. 8baf6f2d5e

Birth control in the United States Birth control in the United States is available in many forms. Sterilization procedures, including tubal ligations and vasectomies, are also performed. Some of the forms available at drugstores and some retail stores are male condoms, female Birth control in the United States is available in many forms. Forms available at pharmacies with a doctor's prescription or at doctor's offices are oral contraceptive pills, patches, vaginal rings, diaphragms, shots/injections, cervical caps, implantable rods, and intrauterine devices (IUDs). Some of the forms available at drugstores and some retail stores are male condoms, female condoms, sponges, spermicides, over-the-counter progestin-only contraceptive pills, and over-the-counter emergency contraception 8baf6f2d5e

Vitamin K reaction Preventative use of vitamin K injections can help reduce risk of HDN. The liver utilizes vitamin K to produce coagulation factors that help the body form blood clots which prevent excessive bleeding. Some parents may refuse the vitamin K shot given at birth to help reduce risk of HDN Vitamin K reactions are adverse side effects that may occur after injection with vitamin K. Vitamin K injections are administered to newborns as a preventative measure to reduce the risk of hemorrhagic disease of the newborn (HDN) 8baf6f2d5e

Confirming that pregnant women are up to date on tetanus immunization during each pregnancy can prevent both maternal and neonatal tetanus. 8baf6f2d5e

Pain management during childbirth The amount of pain a woman feels during labor depends partly on the size and position of her baby, the size of her pelvis, her emotions, the strength of the contractions, and her outlook. Tension increases pain during labor. Childbirth is different for each woman and predicting the amount of pain experienced during birth and delivery can not be certain. A positive Pain management during childbirth is the partial treatment and a way of reducing any pain that a woman may experience during labor and delivery. Virtually all women worry about how they will cope with the pain of labor and delivery. decrease the need for pharmacological pain control and increase the likelihood of spontaneous vaginal births as opposed to cesarean section 8baf6f2d5e

Birth control Birth control, also known as contraception, anticonception, and fertility control, is the use of methods or devices to prevent pregnancy. Some cultures limit or discourage access to birth control because they consider it to be morally, religiously, or politically undesirable. Birth control has been used since ancient times, but effective and safe methods of birth control only became available in the 20th century 8baf6f2d5e

Vitamin K can influence bone health, coagulation, and insulin sensitivity, but it can also be effected by bariatric surgery which can result in vitamin K deficiency. Vitamin K reactions, such as dermatological and anaphylactic reactions, can cause itchiness, reddening of superficial skin, difficulty breathing, and changes to

blood pressure. 8baf6f2d5e In 1929, Henrik Dam discovered Vitamin K, also known as phyloquinone, phytonadione, or phytomenadione, which is a fat-soluble vitamin. Vitamin K is a family of structures of the aforementioned... 8baf6f2d5e This statute prohibits a method of abortion; the statute calls the prohibited method "partial birth abortion." The procedure described in the statute is used in the second trimester, from 15 to 26 weeks, most of which occurs before viability. The law itself contains no reference to gestational age or viability. The statute is directed only at a method of abortion, rather than at preventing any woman from obtaining an abortion. 8baf6f2d5e == Background == 8baf6f2d5e Prior to the 20th century, childbirth predominantly happened in the home, without access to any medical interventions for pain management. Childbirth was a leading cause of death for women, and many were fearful of the process, creating a large desire for pain management. But despite the demands of female patients, little relief was offered before the mid-19th century. Chemical anesthesia during labor was first introduced in 1847, receiving support from women and reluctance from physicians. Some doctors and religious authorities argued that pain relief in childbirth went contrary to God's choice... 8baf6f2d5e

The World Health Organization and United States Centers for Disease Control and Prevention provide guidance on the safety of birth control methods among women with specific medical conditions. The most effective methods of birth control are sterilization by means of vasectomy in males and tubal ligation in females, intrauterine devices (IUDs), and implantable birth control. This is followed by a number of hormone-based methods including contraceptive pills, patches, vaginal rings, and injections. Less effective methods include physical barriers such as condoms, diaphragms and fertility awareness methods. The least effective methods are spermicides and withdrawal by the male before ejaculation... 8baf6f2d5e
