

Minimum Inhibitory Concentration Testing

McFarland standards An example of such testing is antibiotic susceptibility testing by measurement of minimum inhibitory concentration which is routinely used in medical microbiology and research. standardize microbial testing. If a suspension used is too heavy or too dilute, an erroneous result (either falsely resistant or falsely susceptible) for any given antimicrobial agent could occur. An example of such testing is antibiotic susceptibility testing by measurement of minimum inhibitory concentration which is routinely In microbiology, McFarland standards are used as a reference to adjust the turbidity of bacterial suspensions so that the number of bacteria will be within a given range to standardize microbial testing 0d8827897c

The MIC is determined by preparing a dilution series of the chemical, adding agar or broth, then inoculating with bacteria or fungi, and incubating at a suitable temperature. The value obtained is largely dependent on the susceptibility of the microorganism and the antimicrobial potency of the chemical, but other variables can affect results too. The MIC is often expressed in micrograms per milliliter ($\mu\text{g/mL}$) or milligrams per liter (mg/L). 0d8827897c In diagnostic labs, MIC test results are used to grade the susceptibility of microbes. These grades are assigned based on agreed upon values called breakpoints. Breakpoints are published by standards development organizations such as the U.S. Clinical and Laboratory Standards Institute (CLSI), the British Society for Antimicrobial Chemotherapy (BSAC) and the European Committee on Antimicrobial Susceptibility Testing (EUCAST). The purpose of measuring MICs and

grading microbes is to enable... 0d8827897c pIC

Lethal dose The lethal concentration is a lethal dose measurement used for gases or particulates. requirement for the oral test in 2001. The LD may be based on the standard person concept, a theoretical individual that has perfectly "normal" characteristics, and thus not apply to all sub-populations. Draize test EC50 (half maximal effective concentration) IC50 (half maximal inhibitory concentration) EID50 Egg Infective In toxicology, the lethal dose (LD) is an indication of the lethal toxicity of a given substance or type of radiation. Because resistance varies from one individual to another, the "lethal dose" represents a dose (usually recorded as dose per kilogram of subject body weight) at which a given percentage of subjects will die 0d8827897c

== References == 0d8827897c Like the Clinical and Laboratory Standards Institute, EUCAST offers guidelines to interpret raw minimum inhibitory concentrations (MICs), the lowest concentration of a chemical, usually a drug, which prevents visible growth of bacterium. The interpretation to antimicrobial resistance (reported as "R") or antimicrobial susceptibility (reported as "S") differs for all bug-drug combinations which is why guidelines are needed. 0d8827897c Sometimes, IC50 values are converted to the pIC50 scale. 0d8827897c

Agar dilution researchers to determine the minimum inhibitory concentration (MIC) of antibiotics. It is the dilution method most frequently used to test the effectiveness of Agar dilution is one of two methods (along with broth dilution) used by researchers to determine the minimum inhibitory concentration (MIC) of antibiotics. It is the dilution method most frequently used to test the effectiveness of new antibiotics when a few antibiotics are tested against a large panel of different bacteria 0d8827897c

== Use == 0d8827897c == Median lethal dose (LD50) == 0d8827897c Sensitivity testing usually occurs in a medical laboratory, and uses culture methods that expose bacteria to antibiotics, or genetic methods that test to see if bacteria have genes that confer resistance. Culture methods often involve measuring the diameter of areas without bacterial growth, called zones of inhibition, around paper discs containing antibiotics on agar culture dishes that have been evenly inoculated with bacteria. The minimum inhibitory concentration (MIC), which is the lowest concentration of the antibiotic that inhibits bacterial growth, can be estimated from the size of the zone of inhibition using standardized guidelines... 0d8827897c Etest is a quantitative technique for determining the MIC of microorganisms. It is used for a range of Gram-negative and Gram-positive bacteria such as *Pseudomonas*, *Staphylococcus*, and *Enterococcus* species, as well as fastidious bacteria, such as *Neisseria* and *Streptococcus pneumoniae*. It can also be used to determine MICs against certain fungi. 0d8827897c == Process == 0d8827897c

Minimum inhibitory concentration In microbiology, the minimum inhibitory concentration (MIC) is the lowest concentration of a chemical, usually a drug, which prevents visible in vitro In microbiology, the minimum inhibitory concentration (MIC) is the lowest concentration of a chemical, usually a drug, which prevents visible in vitro growth of bacteria or fungi. MIC testing is performed in both diagnostic and drug discovery laboratories 0d8827897c

== Resistance == 0d8827897c The standard can be compared visually to a suspension of bacteria in sterile saline or nutrient broth. If the bacterial suspension is too turbid... 0d8827897c Etest is a pre-prepared non-porous plastic reagent strip with a predefined gradient of antibiotic, covering a continuous concentration range. It is applied to the surface of an agar plate... 0d8827897c

European Committee on Antimicrobial Susceptibility Testing It was formed in 1997 and is jointly organized by ESCMID, ECDC and other European laboratories. EUCAST offers guidelines to interpret raw minimum inhibitory concentrations (MICs), the lowest concentration of a chemical, usually a drug, which prevents European Committee on Antimicrobial Susceptibility Testing (EUCAST) is a scientific committee for defining guidelines to interpret antimicrobial resistance 0d8827897c

IC50 IC50 values are typically expressed as molar concentration. IC50 is a quantitative measure that indicates how much of a particular inhibitory substance (e. Half maximal inhibitory concentration (IC50) is a measure of the potency of a substance in inhibiting a specific biological or biochemical function. drug) is needed to inhibit, in vitro, a given biological process or biological component by 50%. The biological component could be an enzyme, cell, cell receptor or microbe. g. IC50 Half maximal inhibitory concentration (IC50) is a measure of the potency of a substance in inhibiting a specific biological or biochemical function 0d8827897c

For decades, *Streptococcus pneumoniae* has been considered susceptible to optochin; but some strains have been found to be resistant to optochin in laboratory testing. This is notable because the emergence of optochin-resistant strains would invalidate the distinguishing test described... 0d8827897c

Antibiotic sensitivity testing It is used because bacteria may have resistance to some antibiotics. The minimum inhibitory concentration (MIC), which is the lowest concentration of the antibiotic that inhibits bacterial Antibiotic sensitivity testing or antibiotic susceptibility testing is the measurement of the susceptibility of bacteria to antibiotics. evenly inoculated with bacteria. Sensitivity testing results can

allow a clinician to change the choice of antibiotics from empiric therapy, which is when an antibiotic is selected based on clinical suspicion about the site of an infection and common causative bacteria, to directed therapy, in which the choice of antibiotic is based on knowledge of the organism and its sensitivities 0d8827897c

Minimum bactericidal concentration The MBC is identified by determining the lowest concentration of antibacterial agent that reduces the viability of the initial bacterial inoculum by ≥ 99 . The MBC is complementary to the MIC; whereas the MIC test demonstrates the lowest level of antimicrobial agent that inhibits growth, the MBC demonstrates the lowest level of antimicrobial agent that results in microbial death. Examples of antibacterial agents which do this include flavonoids. It can be determined from broth dilution minimum inhibitory concentration (MIC) tests by subculturing to agar plates that do not contain the test agent. 9%. determined from broth dilution minimum inhibitory concentration (MIC) tests by subculturing to agar plates that do not contain the test agent. Antibacterial agents are usually regarded as bactericidal if the MBC is no more than four times the MIC. The MBC is identified The minimum bactericidal concentration (MBC) is the lowest concentration of an antibacterial agent required to kill a particular bacterium. This means that even if a particular MIC shows inhibition, plating the bacteria onto agar might still result in organism proliferation because the antimicrobial did not cause death. Because the MBC test uses colony-forming units as a proxy measure of bacterial viability, it can be confounded by antibacterial agents which cause aggregation of bacterial cells 0d8827897c

EUCAST guidelines are one of the most popular breakpoint guidelines used in antimicrobial susceptibility testing worldwide. The EUCAST guidelines are freely available to all of their users.

0d8827897c IC₅₀ can be determined with functional assays or with competition binding assays.
0d8827897c IC₅₀ is commonly used as a measure of antagonist drug potency in pharmacological research. IC₅₀ is comparable to other measures of potency, such as EC₅₀ for excitatory drugs. EC₅₀ represents the dose or plasma concentration required for obtaining 50% of a maximum effect in vivo.
0d8827897c

Etest It is a laboratory test used in healthcare settings to help guide physicians by indicating what concentration of antimicrobial could successfully be used to treat patients' infections. A strain of bacterium or fungus will not grow near a concentration of antibiotic or antifungal if it is sensitive. For some microbial and antimicrobial combinations, the results can be used to determine a minimum inhibitory concentration (MIC). to determine a minimum inhibitory concentration (MIC). Etest is a proprietary system manufactured by bioMérieux. Etest is a proprietary system manufactured by bioMérieux. It is a laboratory test used in healthcare Etest (previously known as the Epsilometer test) is a way of determining antimicrobial sensitivity by placing a strip impregnated with antimicrobials onto an agar plate

Now there are McFarland standards prepared from suspensions of latex particles, which lengthens the shelf life and stability of the suspensions. 0d8827897c

Optochin In very high dilutions, it inhibits the growth of representatives of all four groups of pneumococci in vitro. are resistant to optochin will not be affected. In vitro, a minimum inhibitory concentration (MIC) of 1:10,000,000 will inhibit the growth of pneumococci Optochin (or ethylhydrocupreine hydrochloride) is a derivative of quinine introduced in 1911 by Morgenroth and Levy with the intention to treat pneumococci infection. That is the main reason it is

now used in bacteriology for the differentiation of *Streptococcus pneumoniae*, which is optochin-sensitive, from the other, resistant alpha-hemolytic streptococci, sometimes called the viridans streptococci because of the green colouration on blood agar around colonies 0d8827897c

The antibiotic to be tested is diluted with water to produce a series of concentrations. An appropriate volume is then combined with melted agar to produce plates in which the final antibiotic concentrations represent a 2-fold dilution series. After this, bacteria prepared to a standard concentration are added as a spot to each plate, with 10⁴ colony forming units (CFU) per spot. This technique allows for replicate spots of one bacterial type to be tested or spots of different bacteria so that the MIC of the antibiotic against multiple types of bacteria can be tested. Necessary controls include a control plate that does not receive any antibiotics and bacterial spread plates demonstrating that the bacteria included are in the correct concentration range. The dilution plates are then incubated at a temperature of 37 degrees Celsius. The plates are... 0d8827897c The growth of bacteria that are optochin-sensitive will show a zone of inhibition around an optochin disc, while the growth of bacteria that are resistant to optochin will not be affected. In vitro, a minimum inhibitory concentration (MIC) of 1:10,000,000 will inhibit the growth of pneumococci, and 1:500,000 is bactericidal. 0d8827897c Original McFarland standards were made by mixing specified amounts of barium chloride and sulfuric acid together. Mixing the two compounds forms a barium sulfate precipitate, which causes turbidity in the solution. A 0.5 McFarland standard is prepared by mixing 0.05 mL of 1.175% barium chloride dihydrate (BaCl₂•2H₂O), with 9.95 mL of 1% sulfuric acid (H₂SO₄). 0d8827897c
