For any gas, it is the mass of CO2 that would warm the earth as much as the mass of that gas. Thus it provides a common scale for measuring the climate effects... a892684a90

Global warming potential It has SI units of grams per kilometer (g/km), often denoted "grams of carbon dioxide equivalent per kilometer" (gCO2e/km) Global warming potential (GWP) is a measure of how much heat a greenhouse gas (GHG) traps in the atmosphere over a specific time period, relative to carbon dioxide (CO2). It is a dimensionless quantity expressed as a multiple of warming caused by the same mass of CO2. For other gases, it depends on how strongly the gas absorbs thermal radiation, how quickly it leaves the atmosphere, and the time frame considered. Therefore, by definition CO2 has a GWP of 1. distance, as used for vehicle travels a892684a90

== History == a892684a90 By the late 19th century, there was an effort to make the base unit the kilogram and the gram a derived unit. In 1960, the new International System of Units defined a gram as one thousandth of a kilogram (i.e., one gram is 1×10−3 kg). The kilogram, as of 2019, is defined by the International Bureau of Weights and Measures from the metre, the second, and from the fixed numerical value of the Planck constant (h). a892684a90 == Background == a892684a90
