

What Is The Airspeed Velocity Of An Unladen Swallow

Monty Python and the Holy Grail grossed more than any other British film screened in the US in 1975, and has since been considered one of the greatest comedy films of all time. In the US, it was selected in 2011 as the second-best comedy of all time in the ABC special Best in Film: The Greatest Movies of Our Time behind Airplane!. In the UK, readers of Total Film magazine in 2000 ranked it the fifth-greatest comedy...

Will any of the Near Field Technologies offer an electronic receipt on the NFT device and online with a item list? --DeeperQA (talk) 02:38, 10 October 2011 (UTC) f2ad7a654f I was wondering what the correlation between firing two different projectiles (of different masses) doing equal amounts of damage (in terms of kinetic energy), and their recoil. Lets say you have a 5.56×45mm NATO round fired at 940m/s. According to that article the bullet should have 1,767 joules of energy. The round itself is 4 grams approx. So lets say you have a projectile that is 4 miligrams instead. According to my calculations (I hope I didn't mess up my math), the projectile would have to move at 29,724m/s in order to have the same energy of 1,767 joules. My question is, if you had a weapon that could somehow fire this tiny projectile at such a high velocity, would the recoil be less? And if so, by how much? How do I use that information without simply cutting and pasting? == f2ad7a654f The copyright issues do seem to be adequately addressed. The source, however, is neither peer-reviewed nor independent. The assertions in the article are not easily verifiable and, based on the evidence presented below, may be fundamentally unanswerable. Similar analysis in, for example, Star Wars, would generally be categorized as non-

canon or fan fiction. Because of those concerns, I am going to have to add my voice to those calling the content unsuitable for Wikipedia. Acting as an ordinary editor, I am going to be bold and turn this into a redirect.
