Collagen is also abundant in corneas, blood vessels, the gut, intervertebral discs, and dentin. In muscle tissue, it serves as a major component of the endomysium. Collagen constitutes 1% to 2% of muscle tissue and 6% by weight of skeletal muscle. One must also consider the elasticity of the thread and ability to adapt to different tissues, as well as the memory of the thread material which lends to ease of use for the operator. The stopping or controlling of bleeding is called hemostasis and is an important part of both first aid and surgery.

Collagen It is mostly found in cartilage, bones, tendons, ligaments, and skin. Amino acids are bound together to form a triple helix of elongated fibril known as a collagen helix. Vitamin C is vital for collagen synthesis. It is the most abundant protein in mammals, making up 25% to 35% of protein content. From the Greek for glue, kolla, the word collagen means "glue producer" and refers to the early process of boiling the skin and sinews of Collagen () is the main structural protein in the extracellular matrix of the connective tissues of many animals.

List of polyurethane applications Its use in garments is growing: for example, in lining the cups of brassieres. In both cases, the foam is usually behind other materials: flexible foams are behind upholstery fabrics in commercial and domestic furniture; rigid foams are between metal, or plastic walls/sheets of most refrigerators and freezers, or other surface materials in the case of thermal insulation panels in the construction sector. Polyurethane is also used for moldings which include door frames, columns, balusters, window headers, pediments, medallions and rosettes. Over three quarters of the global consumption of polyurethane products is in the form of foams, with flexible and rigid types being roughly equal in market size. polyurethane glue in the bookbinding industry: PUR is better than hotmelt or cold glue for most applications.
