Production and secretion of oxytocin is controlled by a positive feedback mechanism, where its initial release stimulates production and release of further oxytocin. For example, when oxytocin is released during a uterine contraction at the start of childbirth, this stimulates the production and release of more oxytocin and an increase in the intensity and frequency of contractions. This process intensifies in frequency and continues until the triggering activity ceases. A similar process takes place during lactation and during sexual activity. 09c16c5749
