

Pars Plana Vitrectomy Meaning

The neural retina consists of several layers of neurons interconnected by synapses and is supported by an outer layer of pigmented epithelial cells. The primary light-sensing cells in the retina are the photoreceptor cells, which are of two types: rods and cones. Rods function mainly in dim light and provide monochromatic vision. Cones function in well-lit conditions and are responsible for the perception of colour through the use of a range of opsins, as well as high-acuity vision used for tasks such as reading. A third type of light-sensing cell, the photosensitive ganglion cell, is important for entrainment of circadian rhythms and reflexive responses such as the pupillary light reflex.

The word "garnet" comes from the 14th-century Middle English word gernet, meaning dark red. It is borrowed from Old French grenate from Latin granatus, from granum (grain, seed). This is possibly a reference to mela granatum or even pomum granatum ('pomegranate', Punica granatum), a plant whose fruits contain abundant and vivid red seed covers (arils), which are similar in shape, size, and color to some garnet crystals. Hessonite garnet is also named gomed in Indian...

Garnet minerals, while sharing similar physical and crystallographic properties, exhibit a wide range of chemical compositions, defining distinct species. These species fall into two primary solid solution series: the pyrope series (pyrope, almandine, spessartine), with the general formula $[Mg,Fe,Mn]_3Al_2(SiO_4)_3$; and the ugrandite series (uvarovite, grossular, andradite), with the general formula $Ca_3[Cr,Al,Fe]_2(SiO_4)_3$. Notable varieties of grossular include hessonite and tsavorite.

Light striking the retina initiates...

Abscess - A collection of pus that has built up within the tissue of the body.

Accommodation - the process by which the eye focuses on an object.

Abductor pollicis brevis muscle - A muscle in the hand that abducts (straightens) the thumb.

Retina retinopexy, scleral buckle, cryotherapy, laser photocoagulation and pars plana vitrectomy. The optics of the eye create a focused two-dimensional image of the visual world on the retina, which then processes that image within the retina and sends nerve impulses along the optic nerve to the visual cortex to create visual perception. The retina serves a function that is in many ways analogous to that of the film or image sensor in a camera.

retinae or retinas) is the innermost, light-sensitive layer of tissue of the eye. Both hypertension and diabetes mellitus can cause damage to the

The retina (from Latin rete 'net'; pl

Garnet JS; Ang, Ghee Soon (2017-06-01). The Cochrane Database of Systematic Reviews Garnets () are a group of silicate minerals that have been used since the Bronze Age as gemstones and abrasives.

“Nd:YAG laser vitreolysis versus pars plana vitrectomy for vitreous floaters”

Accommodation reflex - a reflex action of the eye, measured as a response to focusing on a near...

Abdominal external oblique muscle - The largest, and outermost, of the three flat muscles of the lateral anterior abdominal wall.

Abductor pollicis longus muscle - One of the extrinsic muscles of the hand. Its major function is to abduct the thumb at the wrist.

Aarskog–Scott syndrome - (AAS) A rare, inherited (X-linked) disease characterized by short stature, facial abnormalities, skeletal and genital anomalies.

== Etymology ==

Abdominal internal oblique muscle - A muscle of the abdominal wall, which lies below the external oblique and just above the transverse abdominal muscles.

Although garnets are often associated with metamorphism, they can also occur in volcanic rocks on rare occasions.

Abdomen - The part of the body between the chest and pelvis, which contains most of the tubelike organs of the digestive tract, as well as several solid organs.
