Cement Concrete is the most widely used material in existence and is behind only water as the planet's most-consumed resource. Cement is seldom used on its own, but rather to bind sand and gravel (aggregate) together. the four main mineral phases of the clinker, abbreviated in the cement chemist notation, being: C3S: alite (3CaO·SiO2); C2S: belite (2CaO·SiO2); C3A: A cement is a binder used for construction that sets, hardens, and adheres to other materials to bind them together. Hydraulic cements such as Portland cement set and become adhesive through a chemical reaction between the dry ingredients and water. The chemical reaction results in mineral hydrates that are not very water-soluble. This allows setting in wet conditions or under water and further protects the hardened material from chemical attack. The chemical process for hydraulic cement was found by ancient Romans who used volcanic ash (pozzolana) with added lime (calcium oxide). Wikipedia:Language learning centre/Word list action-packed actionable actions activate activated activates activating activation activations activator activators active actively actives activism Drawing up a comprehensive list of words in English is important as a reference when learning a language as it will show the equivalent words you need to learn in the other language to achieve fluency. Eventually these words will all be translated into big lists in many different languages and using the words in phrase contexts as a resource. A big list will constantly show you what words you don't know and what you need to work on and is useful for testing yourself. You can use the list to generate your own lists in whatever language you're learning and to test yourself
