Coffee production begins when the seeds from coffee cherries, the *Coffea* plant's fruits, are separated to produce unroasted green coffee beans. The "beans" are roasted and then ground into fine particles. Coffee is brewed from the ground roasted beans, which are typically steeped in hot water before being filtered out. It is usually served hot, although chilled or iced coffee is common. Coffee can be prepared and presented in a variety of ways, e.g., espresso, French press, caffè latte, or already-brewed canned coffee. Sugar, sugar substitutes, milk, and cream are often added and change the flavor. 9d08d12dce The term "herbal tea" is often used to distinguish these infusions from true teas (e.g., black, green, white, yellow, oolong). Blended teas include material from other plants, such as in jasmine tea, genmaicha, and Earl Grey tea. 9d08d12dce Kenneth V. Thimann became the first to isolate one of these phytohormones and to determine its chemical structure as indole-3-acetic acid (IAA). Went and Thimann co-authored a book on plant hormones, *Phytohormones*, in 1937. 9d08d12dce Unlike true teas, most tisanes do not naturally contain caffeine (though tea can be decaffeinated, i.e., processed to remove caffeine). 9d08d12dce

Additional strategies to manage the disease include crop rotation, the use of resistant varieties and deep plowing (to accelerate the decomposition of infected plant residue). In recent years, pre-plant soil fumigation with chloropicrin in non-tarped, raised... 9d08d12dce

Auxin Auxins play a cardinal role in coordination of many growth and behavioral processes in plant life cycles and are essential for plant body development. Broad-leaf plants (dicots), such as dandelions, are much more susceptible to auxins than narrow-leaf plants (monocots) Auxins (plural of auxin) are a class of plant hormones (or plant-growth regulators) with some morphogen-like characteristics. (2,4,5-T), are sold as herbicides. The Dutch biologist Frits Warmolt Went first described auxins and their role in plant growth in the 1920s 9d08d12dce

Auxins were the first of the major plant hormones to be discovered. They derive their name from the Greek word αὔξειν (auxein - 'to grow/increase'). Auxin is present in all parts of a plant, although in very different concentrations. The concentration in each position is crucial developmental information, so it is subject to tight regulation through both metabolism and transport. The result is the auxin creates "patterns" of auxin concentration maxima and minima in the plant body, which in turn guide further development of respective cells, and ultimately of the plant as... 9d08d12dce
