Paracetamol relieves pain in acute mild migraine and episodic tension headaches. At a standard dose, paracetamol slightly reduces fever, though it is inferior to ibuprofen in that respect: the benefits of its use for fever are unclear, particularly in the context of fever of viral origins. Paracetamol is effective for pain after wisdom tooth extraction, but it is less effective than ibuprofen. The combination of paracetamol and ibuprofen provides greater analgesic efficacy than either drug alone. The pain relief paracetamol provides in osteoarthritis is small and clinically insignificant. Evidence supporting its use in low back pain, cancer pain, and neuropathic pain is insufficient. Paracetamol is the first-line treatment for pain and fever in pregnancy; no causal association with neurodevelopmental disorders has been established, while untreated pain and fever can harm the mother and fetus. e0aa4daf4f == Early life == e0aa4daf4f In dentistry, local anesthetic medications (LA) are often used to control any potential pain that may occur with procedures. Local anesthetic injections are given in specific areas of the mouth, rather than the whole body. Although several different medications are available, the most commonly used local anesthetic to prevent pain in the area around a tooth is lidocaine (also called xylocaine or lignocaine). Lidocaine's half-life in the body is about 1.5-2 hours. The time it takes for the anesthetic medication to prevent pain in the area (speed of onset) and length of time that the area does not have painful sensations are considerations when choosing an appropriate approach to dental treatment. Other considerations include procedural considerations, the presence of inflammation, techniques used to administer the anesthetic medication, and adverse effects. In root canal treatment, for example, more Lidocaine is required than for a simple filling. e0aa4daf4f Medical abortion is both safe and effective throughout a range of gestational ages, including the second and third trimester. It gets progressively riskier and less

effective as the pregnancy advances, especially in the third trimester. In the United States, the mortality rate for medical abortion is 14 times lower than the mortality rate for childbirth, and the rate of serious complications requiring hospitalization or blood transfusion is less than 0.4%.
