

Which One Is Not A Source Of Carbohydrate

== Structure == There is no good evidence that low-carbohydrate dieting in general confers any particular health benefits apart from weight loss, where low-carbohydrate diets achieve outcomes similar to other diets, as weight loss is mainly determined by calorie restriction and adherence. The original therapeutic diet... ChREBP is a sugar-sensing transcription factor, mediating genomic responses to carbohydrate availability in metabolic tissues such as liver and adipose tissue. ChREBP is crucial in nutrient sensing, glucose uptake and regulation of nutrient metabolism and energy homeostasis through metabolic processes such as glycolysis and lipogenesis. However, many of the mechanisms involved are not yet well understood.

Carbohydrate Structure Database CSDB stores published structural, taxonomical, bibliographic and NMR-spectroscopic data on natural carbohydrates and carbohydrate-related molecules. Zelinsky Institute of Organic Chemistry, Russian Academy of Sciences. D. Carbohydrate Structure Database (CSDB) is a free curated database and service platform in glycoinformatics, launched in 2005 by a group of Russian scientists Carbohydrate Structure Database (CSDB) is a free curated database and service platform in glycoinformatics, launched in 2005 by a group of Russian scientists from N

Carbohydrates perform numerous roles in living organisms. Polysaccharides serve as an energy store (e.g., starch and glycogen) and as structural components (e.g., cellulose in plants and chitin in arthropods and fungi). The 5-carbon monosaccharide ribose is an important component of coenzymes (e.g., ATP, FAD and NAD) and the backbone of the genetic molecule known as RNA. The related deoxyribose is a component of DNA. Saccharides and their derivatives play key roles in the immune system, fertilization, preventing pathogenesis, blood clotting, and development.

Protein-carbohydrate interaction Compared to the study of protein-protein and protein-DNA interaction, it is relatively recent that scientists get to know the protein-carbohydrate binding. That is, they are specifically recognized by other biomolecules. Carbohydrates are important biopolymers and have a variety of functions. basis of specific recognition of carbohydrates by lectins. Carbohydrates are important biopolymers and have a variety of functions. Often carbohydrates

serve Carbohydrate-protein interactions are the intermolecular and intramolecular interactions between protein and carbohydrate moieties. These interactions form the basis of specific recognition of carbohydrates by lectins. Proteins which bind carbohydrate structures are known as lectins. Often carbohydrates serve a function as a recognition element af89a3ac61

CSDB provides access to several carbohydrate-related research tools: af89a3ac61 In humans, carbohydrates are available directly from consumption, from carbohydrate storage, or by conversion from fat components including fatty acids that are either stored or consumed directly. af89a3ac61

Carbohydrate catabolism Carbohydrate catabolism is the metabolic breakdown of carbohydrates to release chemical energy that can be conserved as adenosine triphosphate (ATP). Glycolysis does not require oxygen. Glucose is initially metabolized through glycolysis, a pathway in the cytosol that converts one glucose molecule into two molecules of pyruvate, with a net production of two ATP and two NADH molecules. Carbohydrate catabolism is the metabolic breakdown of carbohydrates to release chemical energy that can be conserved as adenosine triphosphate (ATP) af89a3ac61

Ketogenic diet The ketogenic diet is a high-fat, adequate-protein, low-carbohydrate dietary therapy that in conventional medicine is used mainly to treat hard-to-control The ketogenic diet is a high-fat, adequate-protein, low-carbohydrate dietary therapy that in conventional medicine is used mainly to treat hard-to-control (refractory) epilepsy in children. The diet forces the body to burn fats rather than carbohydrates af89a3ac61

== Enzyme mechanism == af89a3ac61

Carbohydrate sulfotransferase Carbohydrates are used by cells for a wide range of functions from structural purposes to extracellular communication. As extracellular compounds, sulfated carbohydrates are mediators of intercellular communication, cellular adhesion, and ECM maintenance. Sulfation, performed by carbohydrate sulfotransferases, generates carbohydrate sulfate esters ($-O-SO_3$). Carbohydrates are suitable for such a wide variety of functions due to the diversity in structure generated from monosaccharide composition, glycosidic linkage positions, chain branching, and covalent modification. Possible covalent modifications include acetylation, methylation, phosphorylation, and sulfation. These sulfate esters are only located extracellularly, whether through excretion into the extracellular matrix (ECM) or by presentation on the cell surface. In biochemistry, carbohydrate sulfotransferases are enzymes within the class of sulfotransferases which catalyze the transfer of the sulfate ($-SO_3$) functional In

biochemistry, carbohydrate sulfotransferases are enzymes within the class of sulfotransferases which catalyze the transfer of the sulfate ($-\text{SO}_3$) functional group to carbohydrate groups in glycoproteins and glycolipids

One particular form of low-carbohydrate diet called the ketogenic diet was first established as a medical diet for treating epilepsy. It became a popular diet for weight loss through celebrity endorsement, but there is no evidence of any distinctive... == Classification == The subsequent metabolism of pyruvate depends on the organism and cellular conditions and may proceed through respiration or fermentation. During aerobic respiration, pyruvate is oxidized to acetyl-CoA, which then enters the citric acid cycle. NADH and FADH₂ donate electrons to an electron transport chain, where most ATP is produced through oxidative phosphorylation. In aerobic respiration, oxygen is the terminal electron acceptor, whereas anaerobic respiration uses alternative terminal electron acceptors and is distinct from fermentation. Fermentation regenerates NAD⁺ by oxidizing NADH, allowing glycolysis to continue. It does not produce ATP beyond that generated during glycolysis. Generally, there are two types of protein carbohydrate binding important in biological processes: Lectin and antibody.

Carbohydrate conformation The physical forces that dictate the three-dimensional shapes of all molecules—here, of all monosaccharide, oligosaccharide, and polysaccharide molecules—are sometimes summarily captured by such terms as "steric interactions" and "stereoelectronic effects" (see below). Carbohydrate conformation refers to the overall three-dimensional structure adopted by a carbohydrate (saccharide) molecule as a result of the through-bond Carbohydrate conformation refers to the overall three-dimensional structure adopted by a carbohydrate (saccharide) molecule as a result of the through-bond and through-space physical forces it experiences arising from its molecular structure

Sulfotransferases catalyze the transfer of a sulfonyl group from an activated sulfate donor onto a hydroxyl group (or an amino... Saccharide and other chemical conformations can be reasonably shown using two-dimensional structure representations that follow set conventions; these capture for a trained viewer an understanding of the three-dimensional structure via structure drawings (see organic chemistry article, and "3D Representations" section in molecular geometry article); they are also represented by stereograms on the two dimensional page, and increasingly using 3D display technologies on computer monitors. Carbohydrates in food are converted into glucose, which is then transported around the body and is important in fueling brain function. However, if only a little carbohydrate remains in the diet, the liver converts fat into fatty acids and ketone

bodies, the latter passing into the brain and replacing glucose as an energy source. An elevated level of ketone bodies in the blood (a state called ketosis) eventually lowers the frequency of epileptic seizures. Around half of children and young people with epilepsy who have tried some form of this diet saw the number of seizures drop by at least half, and the effect persists after discontinuing the diet. Some evidence shows that adults with epilepsy may benefit from the diet and that a less strict regimen, such as a modified Atkins diet, is similarly effective. Side effects may include constipation, high cholesterol, growth slowing, acidosis, and kidney stones.

Formally and quantitatively, conformation is captured by description of a molecule's angles—for example, sets of three sequential atoms (bond angles) and four sequential atoms (torsion angles, dihedral... Carbohydrates are central to many essential metabolic pathways. Plants synthesize carbohydrates from carbon dioxide and water through photosynthesis, allowing them to store energy absorbed from sunlight internally. When animals and fungi consume plants, they use cellular respiration to break down these stored carbohydrates to make energy available to cells. Both animals and plants temporarily store the released energy in the form of high-energy molecules, such as adenosine triphosphate (ATP), for use in various cellular processes.

Carbohydrate they are often represented by the empirical formula $(CH_2O)_n$. A carbohydrate (*/ˌkɑːrboʊˈhaɪdreɪt/*) is a sugar (saccharide) or a sugar derivative. Together with amino acids, fats, and nucleic acids, the carbohydrates are one of the major families of biomolecules. For the simplest carbohydrates, the carbon-to-hydrogen-to-oxygen atomic ratio is 1:2:1, i. e. its also called the devil's substance by "carnivore" activists. For the simplest carbohydrates, the carbon-to-hydrogen-to-oxygen atomic A carbohydrate () is a sugar (saccharide) or a sugar derivative

ChREBP is a member of the Mondo family and Myc / Max / Mad superfamily of transcription factors. The two main members of the Mondo family are MondoA (MLX-interacting protein or MLXIP) and ChREBP (MondoB, MLXIPL). Both are characterized by a basic helix-loop-helix leucine zipper (bHLH-ZIP) structure, and form heterodimers with MLX protein.

The main data stored in CSDB are carbohydrate structures of bacterial, fungal, and plant origin. Each structure is assigned to an organism and is provided with the link(s) to the corresponding scientific publication(s), in which it was described. Apart from structural data, CSDB also stores NMR spectra, information on methods used to decipher a particular structure, and some other data.

Carbohydrate metabolism Carbohydrate metabolism is the whole of the biochemical processes responsible for the metabolic formation, breakdown, and interconversion

of carbohydrates Carbohydrate metabolism is the whole of the biochemical processes responsible for the metabolic formation, breakdown, and interconversion of carbohydrates in living organisms af89a3ac61

Low-carbohydrate diet vegetables). , meat, poultry, fish, shellfish, eggs, cheese, nuts, and seeds), as well as low carbohydrate foods (e. One definition, Low-carbohydrate diets restrict carbohydrate consumption relative to the average diet. Foods high in carbohydrates (e. , sugar, bread, pasta) are limited, and replaced with foods containing a higher percentage of fat and protein (e. g. g. g. spinach, kale, chard, collards, and other fibrous vegetables). There is a lack of standardization of how much carbohydrate low-carbohydrate diets must have, and this has complicated research af89a3ac61

== Metabolic pathways == af89a3ac61 Carbohydrates are central to nutrition and are found in a wide variety of natural and processed foods. Starch is a polysaccharide and is abundant in cereals (wheat, maize, rice), potatoes, and processed food based on cereal flour, such as... af89a3ac61 While carbohydrates are essential to human biological processes, consuming them is not essential for humans. There are healthy human populations that do not consume carbohydrates. af89a3ac61 There is a lack of standardization of how much carbohydrate low-carbohydrate diets must have, and this has complicated research. One definition, from the American Academy of Family Physicians, specifies low-carbohydrate diets as having less than 20% of calories from carbohydrates. af89a3ac61 == Glycolysis == af89a3ac61 Many of these interactions involved carbohydrates found at the cell surface, as part of a membrane glycoprotein or glycolipid. These interactions can play a role in cellular adhesion and other cellular recognition events. Intramolecular carbohydrate-protein interactions refer to interactions between glycan and polypeptide moieties in glycoproteins or the glycosylated proteins. af89a3ac61

Carbohydrate-responsive element-binding protein Carbohydrate-responsive element-binding protein (ChREBP), also known as MLX-interacting protein-like (MLXIPL), MondoB, and WBSCR14, is a protein that in Carbohydrate-responsive element-binding protein (ChREBP), also known as MLX-interacting protein-like (MLXIPL), MondoB, and WBSCR14, is a protein that in humans is encoded by the Mlxipl gene. ChREBP has two isoforms, ChREBP- α and ChREBP- β , which are encoded by the same gene using alternative promoters af89a3ac61
