

# Pink Eye In Newborn

In the 21st century, pink is seen as a symbol of femininity, though it has not always been seen this way. Prior to the second half of the 20th century, pink frequently reflected masculinity. Scholars have linked the decisive feminization of pink to the emergence of Barbie in 1959. a941e9fa97 == Types == a941e9fa97 The work is egg tempera and gold leaf on wood with dimensions 43.3 in (109.9 cm) x 33.4 in (84.8 cm). It was created towards the end of the 16th century. The central figure... a941e9fa97 The Trifid Nebula was the subject of an investigation by astronomers using the Hubble Space Telescope in 1997, using filters that isolate emission from hydrogen atoms, ionized sulfur atoms, and doubly ionized oxygen atoms. The images were combined into a false... a941e9fa97

Neonatal conjunctivitis It is typically due to neonatal bacterial infection, although it can also be non-infectious (e. It is typically due to neonatal bacterial Neonatal conjunctivitis, also known as ophthalmia neonatorum) is a form of conjunctivitis (inflammation of the outer eye) which affects newborn babies following birth. Infectious neonatal conjunctivitis is typically contracted during vaginal delivery from exposure to bacteria from the birth canal, most commonly Neisseria gonorrhoeae or Chlamydia trachomatis. , chemical exposure). neonatorum) is a form of conjunctivitis (inflammation of the outer eye) which affects newborn babies following birth. g a941e9fa97

Antibiotic ointment is typically applied to the newborn's eyes within one hour of birth as prevention for gonococcal ophthalmia. This practice is recommended for all newborns, and most hospitals in the United States are required by state law to apply eye drops or ointment soon after birth to prevent the disease. a941e9fa97 == Etymology and definitions == a941e9fa97 The most common infectious causes in adults are viral, whereas in children bacterial causes predominate. The viral infection may occur along with other symptoms of a common cold. Both viral and bacterial cases are easily spread among people. Allergies to pollen or animal hair are also a common cause. Diagnosis is often based on signs and symptoms. Occasionally a sample of the discharge is sent for culture. a941e9fa97 Neonatal conjunctivitis, by definition, presents during the first month of life. Signs and symptoms include: a941e9fa97

Amazon river dolphin g. Newborns and the young have a dark grey tint, which in adolescence transforms into light grey, and in adults turns pink as a result of The Amazon river dolphin (*Inia geoffrensis*), also known as the boto, bufeo or pink river dolphin, is a species of toothed whale endemic to South America and is classified in the family Iniidae. geoffrensis (Amazon river dolphin), *I. humboldtiana* (Orinoco river dolphin). *g. boliviensis* (Bolivian river dolphin) and *I.* The position of the Araguaian river dolphin (*I.* The three subspecies are distributed in the Amazon basin, the upper Madeira River in Bolivia, and the Orinoco basin, respectively. varies with age. araguaiaensis) within the clade is still unclear. *g.* Three subspecies are currently recognized: *I* a941e9fa97

If left untreated, neonatal conjunctivitis can cause blindness. Following umbilical cord clamping during delivery, the umbilicus base will spontaneously separate within 7–15 days. With routine cord care and proper hygienic conditions, the remaining umbilical base will heal and new skin tissue will form. In some instances, a mass of tissue, or granuloma, will form at the base.

**Trifid Nebula** The object is an unusual combination of an open cluster of stars, an emission nebula (the relatively dense, reddish-pink portion), a reflection nebula (the mainly NNE blue portion), and a dark nebula (the apparent 'gaps' in the former that cause the trifurcated appearance, also designated Barnard 85). Viewed through a small telescope, the Trifid Nebula is a bright and peculiar object, and is thus a perennial favorite of amateur astronomers. relatively dense, reddish-pink portion), a reflection nebula (the mainly NNE blue portion), and a dark nebula (the apparent 'gaps' in the former that cause The Trifid Nebula (catalogued as Messier 20 or M20 and as NGC 6514) is an H II region in the north-west of Sagittarius in a star-forming region in the Milky Way's Scutum–Centaurus Arm. It was discovered by Charles Messier on June 5, 1764. Its name means 'three-lobe'

**Champagne gene** If a horse inherits the champagne gene from either or both parents, a coat that would otherwise be chestnut is instead gold champagne, with bay corresponding to amber champagne, seal brown to sable champagne, and black to classic champagne. The most distinctive traits of horses with the champagne gene are the hazel eyes and pinkish, freckled skin, which are bright blue and bright pink at birth, respectively. or amber. A horse must have at least one champagne parent to inherit the champagne gene, for which there is now a DNA test. In the newborn or very young foal, the eyes are bright blue to blue-green and the skin is bright pink. The coat color is also affected: any hairs that would have been red are gold, and any hairs that would have been black are chocolate brown. The champagne blue foal eye is creamier The champagne gene is a simple dominant allele responsible for a number of rare horse coat colors

Unlike the genes underlying tobiano, dominant white, frame overo spotting and the Leopard complex common to the Appaloosa, the champagne gene does not affect the location of pigment-producing cells in the skin. Nor does the champagne gene remove all pigment from the skin and hair, as in albinism. Instead, the champagne gene produces traits known as hypomelanism, or dilution. Champagne is not associated with any health defects. Other... A port-wine stain is a capillary malformation, seen at birth. Port-wine stains persist throughout life. The area of skin affected grows in proportion to general growth. == Description == This star is surrounded by a cluster of approximately 3100 young stars. == Causes ==

**Umbilical granuloma** umbilical abnormality in newborn children or neonates, causing inflammation and drainage. It is the overgrowth of the umbilical tissue. With appropriate treatment, it is expected to heal in 1~2 weeks. It may appear in the first few weeks of newborn infants during the Umbilical granuloma is the most common umbilical abnormality in newborn children or neonates, causing inflammation and drainage. It develops in about 1 out of 500 newborns. It may appear in the first few weeks of newborn infants during the healing process of the umbilical cord due to an umbilical mass

Port-wine stains occur most often on the face but can appear anywhere on the body, particularly on the neck, upper trunk, arms and legs. Early stains are usually flat and pink in appearance. As the child matures, the color may deepen to a dark red or purplish color. In adulthood, thickening of the lesion or the development of small lumps may occur. In the early 21st century, however, childrenswear became heavily influenced by trends in adult fashion. Grandma bait is a retail industry term for expensive children's clothing. Due to the rise of social media platforms such as Instagram, celebrities and fashion bloggers have been using their accounts to post pictures of their children wearing luxury "street style" clothing, thus inspiring parents to dress their children as they would dress themselves. Good quality, well-designed garments are a priority for some parents, and children's clothing is getting a prime place in top-label stores and high-end fashion retail outlets. Clothes are also getting separately designed for boys and girls at a very early age. The most massive star that has formed in this region is HD 164492A, an O7.5III star with a mass more than 20 times the mass of the Sun. Prevention is partly by handwashing. Treatment depends on the underlying cause. In the majority of viral cases, there is no specific treatment. Most cases that are due to a bacterial infection also resolve without treatment; however antibiotics can shorten the illness. People who wear contact lenses and those whose... The color pink is named after the flowers, pinks, flowering plants in the genus Dianthus, and derives from the frilled edge of the flowers. The verb "to pink" dates from the 14th century and means "to decorate with a perforated or punched pattern" (possibly from German picken, "to peck"). It has survived to the current day in pinking shears, hand-held scissors that cut a zig-zagged line to prevent fraying. == Characteristics == Delayed cord separation, mild infections and hygienic conditions are all factors which may contribute to the incidence of umbilical granuloma. Although the exact cause of umbilical granulomas is unknown, it is hypothesized that inflammation of the remaining... Port-wine stains may be part of a syndrome such as Sturge-Weber syndrome or Klippel-Trénaunay-Weber syndrome.

Adoration of the Kings (Damaskinos) According to Damaschino's logic, the king is embraced by kings. The painting is roughly the same size as Damaschino's The Last Supper. He was followed by countless artists both Greek and Italian. He also blended the style with the Venetian technique creating a new prototype of painting. His version of the Adoration of the Kings is a very important painting because it reveals the mixture of painting styles prevalent in most of his works. It is part of the collection of Saint Catherine's Monastery Mount Sinai, Egypt. importance of the visitors of the newborn king. Both paintings were created around the same period. The viewer's eye has to search for the Virgin The Adoration of the Kings, also known as the Adoration of the Magi, is a popular tempera painting by Greek painter Michele Damaschino. He was a Cretan Renaissance painter who painted in the Greek mannerisms prevalent at the time. He was primarily active in Heraklion, Sicily, and Venice. He is a major representative of the Cretan Renaissance. The Adoration of the Kings is now in the Monastery of Agia Aikaterini in Heraklion, Crete. Michele Damaschino painted in parts of Italy and Greece

Conjunctivitis Conjunctivitis can affect one or both eyes. The affected eye may have increased tears or be stuck shut in the morning. Pain, burning, scratchiness, or itchiness may occur. Pain, burning, scratchiness, or itchiness may occur. It makes the eye appear pink or reddish. Itching is more common in cases that are due to allergies. Swelling of the sclera may also occur. The affected eye may have increased tears or be stuck shut in the

Conjunctivitis, also known as pink eye, is inflammation of the conjunctiva, the thin and clear layer that covers the white surface of the eye and the inner eyelid. the eye appear pink or reddish a941e9fa97

Children's clothing Children's clothing is often more casual than adult clothing, fit for play and rest. pink dresses for one baby and then a full set of blue overalls for the next baby. In Children's clothing or kids' clothing is clothing for children who have not yet grown to full height. Before the 1940s, young boys and girls alike wore short dresses a941e9fa97

Pink A combination of pink and white is associated with innocence, whereas a combination of pink and black links to eroticism and seduction. It was first used as a color name in the late 17th century. Amy March uses blue and pink ribbons to tell the difference between her sister Meg's newborn twins. Pink was not a common color in the fashion of the Middle Pink is a pale tint of red or rose, the color of the pink flower a941e9fa97

Port-wine stain If the port-wine stain is around the eye or A port-wine stain (nevus flammeus) is a discoloration of the human skin caused by a vascular anomaly (a capillary malformation in the skin). They are so named for their coloration, which is similar in color to port wine, a fortified red wine from Portugal. a newborn baby's throat with a scope to see if there are any changes (growths) other than just the color a941e9fa97

Umbilical granulomas occur after umbilical cord removal when the remaining ring of the umbilicus undergoes incomplete wound healing and there is excessive healing tissue, also known as granulation tissue. a941e9fa97 == Signs and symptoms == a941e9fa97 The Amazon river dolphin is the largest species of river dolphin, with many adult males reaching 185 kilograms (408 lb) in weight, and 2.5 metres (8.2 ft) in length. Adults acquire a pink color, more prominent in males, giving it its nickname "pink river dolphin". Sexual dimorphism is very evident, with males measuring 16% longer and weighing 55% more than females. Like other toothed whales, they have a melon, an organ that is used for bio sonar. The dorsal fin, although short in height, is regarded as long, and the pectoral fins are also large. The fin size, unfused vertebrae, and its relative... a941e9fa97
