

Earrings For Cartilage Ear Piercing

Locations for piercings other than the earlobe include the rook, tragus, and across the helix (see image in the infobox). The simple term "ear piercing" usually refers to an earlobe piercing, whereas piercings in the upper part of the external ear are often referred to as "cartilage piercings". Cartilage piercings are more complex to perform than earlobe piercings and take longer to heal.

More modern designs of reusable ear-piercing instruments, such as Inverness and Studex System 75, use self-contained, single-use, sealed, and sterilised disposable cartridges or cassettes. The studs used with such systems often have thinner posts (normally 20 gauge) with sharper tips, as opposed to the thicker (16 gauge), blunter posts of the "standard" ear-piercing... Earring components may be made of any number of materials, including metal, plastic, glass, precious stone, beads, wood, bone, and other materials. Designs range from small hoops and studs to large plates and dangling items. The size is ultimately limited by the physical capacity of the earlobe to hold the earring without tearing. However, heavy earrings worn over extended periods of time can lead to stretching of the piercing; ear stretching can also be done intentionally.

Piercing guns have been widely criticized as dangerous among professional body piercers. The use of older designs of piercing gun can possibly carry an increased risk of disease transmission, as compared to methods used by professional piercers. Piercing guns have been criticised for causing damage (sometimes mischaracterised as blunt-force trauma) to the skin and underlying tissue. Diminished air and blood

circulation in tissue compressed by a piercing gun can lead to prolonged healing, minor complications and scarring. 58303b1c00
