Signs and symptoms of pregnancy Each pregnancy can be quite different and many people do not experience the same or all of the symptoms. Pregnancy symptoms may be categorized based on trimester as well as region of the body affected. Signs and symptoms of pregnancy typically change as pregnancy progresses, although several symptoms may be present throughout. Low back pain and pelvic girdle pain – Pregnancy-related low back pain (PLBP) and pregnancy-related pelvic girdle pain (PGP) are common conditions Signs and symptoms of pregnancy are common, benign conditions that result from the changes to the body that occur during pregnancy. maternal health. Depending on severity, common symptoms in pregnancy can develop into complications. If a person is concerned about their symptoms they should be encouraged to speak with an appropriate healthcare professional 577a2a1ffc

Sacroiliac joint The pain is often a mild to moderate ache around the dimple or posterior superior iliac spine (PSIS) region. The human body has two sacroiliac joints, one on the left and one on the right, that often match each other but are highly variable from person to person. The pain may become The sacroiliac joint or SI joint (SIJ) is the joint between the sacrum and the ilium bones of the pelvis, which are connected by strong ligaments. It is a synovial plane joint with irregular elevations and depressions that produce interlocking of the two bones. The joint is strong, supporting the entire weight of the upper body. In humans, the sacrum supports the spine and is supported in turn by an ilium on each side. unilateral low back pain 577a2a1ffc

Common causes of pain in the abdomen include gastroenteritis and irritable bowel syndrome. About 15% of people have a more serious underlying condition such as appendicitis, leaking or ruptured abdominal aortic aneurysm, diverticulitis, or ectopic pregnancy. In a third of cases, the exact cause is unclear. 577a2a1ffc

Lordosis The term comes from Greek lordos 'bent backward'. However, the terms lordosis and lordotic are also used to refer to the normal inward curvature of the lumbar and cervical regions of the human spine. Similarly, kyphosis historically refers

to abnormal convex curvature of the spine. The normal outward (convex) curvature in the thoracic and sacral regions is also termed kyphosis or kyphotic. causes of lumbar hyperlordosis include tight low back muscles, excessive visceral fat, and pregnancy. Rickets, a vitamin D deficiency in children, can Lordosis is historically defined as an abnormal inward curvature of the lumbar spine 577a2a1ffc

Many of the early signs of pregnancy will be similar to symptoms that come right before a period, and it can be hard to tell the difference. 577a2a1ffc Fitz-Hugh–Curtis syndrome, or perihepatitis, was first described by Carlos Stajano in 1920, who found adhesions between the liver capsule and the abdominal wall in patients suffering from gonococcal infections. 577a2a1ffc Lordosis in the human spine makes it easier for humans to bring the bulk of their mass over the pelvis. This allows for a much more efficient walking gait than that of other primates, whose inflexible spines cause them to resort to an inefficient forward-leaning "bent-knee, bent-waist" gait. As such, lordosis in the human spine is considered one of the primary physiological adaptations of the human skeleton that allows for human gait to be as energetically efficient as it is. 577a2a1ffc The majority of back pain is nonspecific and idiopathic. Common underlying mechanisms include degenerative or traumatic changes to the discs and facet joints, which can then cause secondary pain in the muscles and nerves and referred pain to the bones, joints and extremities. Diseases and inflammation of the gallbladder, pancreas, aorta and kidneys may also cause referred pain in the back. Tumors of the vertebrae, neural tissues and adjacent structures can also manifest as back pain. 577a2a1ffc The condition is named after the two physicians, Thomas Fitz-Hugh Jr. and Arthur Hale Curtis, who further studied the syndrome in the

1930s. They noted the classic "violin string adhesions" in female patients presenting with RUQ abdominal pain. Both Fitz-Hugh and Curtis regularly found these adhesions during laparotomy in patients with the clinical syndrome of RUQ with concern for gallbladder pathology; however, no abdominal pathology was found in these patients but residual gonococcal tubal changes were often noted. 577a2a1ffc Signs and symptoms of early pregnancy may include missed periods, tender breasts, morning sickness (nausea and vomiting), hunger, implantation bleeding, and frequent urination. Pregnancy may be confirmed with a pregnancy test. Methods of contraception are used to avoid pregnancy. 577a2a1ffc == Structure == 577a2a1ffc Common side effects include dizziness, back pain, and upper respiratory tract infections. Serious side effects may include low blood pressure, kidney problems, allergic reactions, and electrolyte problems. Use in pregnancy and breastfeeding is not recommended. Conception usually occurs following vaginal intercourse, but can also occur through assisted reproductive technology procedures. A pregnancy may end in a live birth, a miscarriage, an induced abortion, or a stillbirth. Childbirth typically occurs around 40 weeks from the start of the last menstrual period (LMP), a span known as the gestational age; this is just over nine months. Counting by fertilization age, the length is about 38 weeks. Implantation occurs on average 8–9 days after fertilization. An embryo is the term for the developing offspring during the first seven weeks following implantation (i.e. ten weeks' gestational age), after which the term fetus is used until the birth of a baby. 577a2a1ffc Vaginal birth is the most common mode of birth worldwide. It involves three stages of labour: the shortening and opening of the cervix during the first stage, descent and birth of the baby during the second, and the birth of the placenta during the third. During the first stage, contractions gradually become stronger and

closer together. The postpartum period is the time of recovery for the mother and infant, in which both newborn and mother are monitored. All major health organisations advise that immediately after giving birth, regardless of the mode of birth, that the infant be placed on the mother's chest (termed skin-to-skin contact), and to delay any other routine procedures for at least one to two hours or until the baby has had its first breastfeeding.

Back pain An episode of back pain may be acute, subacute or chronic depending on the duration. The pain may be characterized as a dull ache, shooting or piercing pain or a burning sensation. The lumbar region is the most commonly affected area. It may be classified as neck pain (cervical), middle back pain (thoracic), lower back pain (lumbar) or coccydynia (tailbone or sacral pain) based on the segment affected. It may be classified as neck pain (cervical), middle back pain (thoracic), lower back pain (lumbar) Back pain (Latin: dorsalgia) is pain felt in the back.
