

Mulberry Tree And Fruit

Morus nigra is a deciduous tree growing to 12 metres (39 feet) tall by 15 m (49 ft) broad. The leaves are 10–20 centimetres (4–8 inches) long by 6–10 cm (2–4 in) broad – up to 23 cm (9 in) long on vigorous shoots, downy on the underside, the upper surface rough with very short, stiff hairs. Each somatic cell has 308 chromosomes in total, and exhibits tetraploidy (4x), meaning that its genome contains seven chromosomes, and each somatic cell has 44 copies of each. This is reported as "the highest number of polyploidies among any known spermatophyte species".

Guava

Morus alba It is also notable for the rapid release of its pollen, which is launched at greater than half the speed of sound. *Morus alba*, known as white mulberry, common mulberry and silkworm mulberry, is a fast-growing, small to medium-sized mulberry tree which grows to 10–20 m. *Morus alba*, known as white mulberry, common mulberry and silkworm mulberry, is a fast-growing, small to medium-sized mulberry tree which grows to 10–20 m (33–66 ft) tall. It is native to China and is widely cultivated and naturalized elsewhere. The species is widely cultivated to feed the silkworms employed in the commercial production of silk.

Apple
In contrast, an aggregate fruit such as a raspberry develops from multiple ovaries of a single flower. In languages other than English, the meanings of "multiple" and "aggregate" fruit are reversed, so that multiple fruits merge several pistils within a single flower.
The scientific study and the cultivation of fruits is called pomology, which divides fruits into groups based on plant morphology and anatomy. Some of those groups are pome fruits, which include apples and pears, and stone fruits, which include peaches/nectarines, almonds, apricots, plums and cherries.
Cashew
The nearby hill Borec is a unique geological and botanical location famous for its hydrothermal vents, micro-exhalations and specific fauna and flora.

Elderberry
Lychee
Morus, the mulberry genus, with several species widely cultivated in China for production of fruit and silk
Grapefruit
Despite their similar appearance, mulberries are not closely related to raspberries or blackberries. All three species belong to the Rosales order. But while the mulberry is a tree belonging to the Moraceae family (also including the fig, jackfruit...
As shown in the photograph of the noni, stages of flowering and fruit development in the noni or Indian mulberry (*Morinda citrifolia*) can be observed on a single branch. First an inflorescence of white flowers called a head is produced. After fertilization, each flower develops into a drupe, and as the drupes expand, they become connate (merge) into a multiple fleshy fruit called a...
The fruit is a compound cluster of several small drupes that are dark purple, almost black when ripe, and they are 2.5 cm (1 in) in diameter. Black mulberry is richly flavoured, similar to the red mulberry (*Morus rubra*) rather than the more insipid fruit of the white mulberry (*Morus alba*). Mulberry fruit color derives from anthocyanins...
Bael
Jackfruit
Coconut

Paper mulberry was used among ancient Austronesians in making barkcloth. Native to subtropical mainland Asia, it provides strong support for the "Out of Taiwan" hypothesis of the Austronesian expansion. Genetic studies have traced paper mulberry in the Remote Pacific back to Taiwan via New Guinea and Sulawesi. Its general absence in the Philippines, where surviving plants largely stem from modern introductions in 1935, suggests earlier prehistoric introductions there went extinct, reinforcing a Taiwanese rather than Island... Loquat *Morus alba*, the most commonly cultivated mulberry in China, and the preferred feed for silkworms Medlar The closely related genus *Broussonetia* is also commonly known as mulberry, notably the paper mulberry (*Broussonetia papyrifera*).

Morus nigra Ripe fruit and foliage of *Morus nigra* A centuries-old tree of *Morus nigra* Female flowers of *Morus nigra* An old black mulberry tree in spring Unripe *Morus nigra*, or the black mulberry, is a species of flowering plant in the family Moraceae that is native to southwestern Asia, where it has been cultivated for so long that its precise natural range is unknown. The black mulberry is known for its large number of chromosomes

Chinese mulberry Chinese mulberry is a common name for several trees and may refer to: *Morus*, the mulberry genus, with several species widely cultivated in China for production Chinese mulberry is a common name for several trees and may refer to:

== Specimen == In some cases, the infructescences are similar in appearance to simple fruits. One example is pineapple (*Ananas*), which is formed from the fusion of the berries with receptacle tissues and bracts. Crab apple Carambola (starfruit) Pawpaw, both the tropical *Carica papaya* and the North American *Asimina triloba* *Maclura tricuspidata*, native to East Asia and related to the mulberries of the genus *Morus*, which produces similar edible fruits

Old Mulberry Tree at Reeves Point [citation needed] Controversy remains as to the person who planted the mulberry tree, and when Old Mulberry Tree at Reeves Point is a tree in the Australian state of South Australia located at Reeves Point in Kingscote on Kangaroo Island. Australia and is the oldest surviving fruit tree in the state. The tree, which was planted as early as 1836, probably by Charles Binden Powell, is associated with the first official European settlement of South Australia and is the oldest surviving fruit tree in the state

Common in the United States, it is listed as an endangered species in Canada, and is susceptible to hybridization with the invasive white mulberry (*M. alba*), introduced from Asia.

Multiple fruit Examples are the fig, pineapple, mulberry, osage orange, and jackfruit. Examples are the fig, pineapple, mulberry, osage orange, and jackfruit. infructescence. In contrast, an aggregate fruit such as a raspberry develops from multiple Multiple fruits, also called collective fruits or multifruits are fruiting bodies formed from a cluster of flowers, the inflorescence. After flowering, the mass is called an infructescence. Each flower in the inflorescence produces a fruit, but these mature into a single mass
