

Side Effects Of Reclast Iv

Alendronic acid was first described in 1978 and approved for medical use in the United States in 1995 as alendronate sodium (Fosamax). It is available as a generic medication. In 2023, it was the 113th... dcf1ff1a26 Particular medications can result in MRONJ, a serious but uncommon side effect in certain individuals. Such medications are frequently used to treat diseases that cause bone resorption such as osteoporosis, or to treat cancer. The main groups of drugs involved are anti-resorptive drugs, and anti-angiogenic drugs. dcf1ff1a26

Alendronic acid Use is often recommended together with vitamin D, calcium supplementation, and lifestyle changes. It is taken by mouth as the neutral sodium salt, alendronate sodium, but is absorbed as the active free drug alendronic acid. Bone: alendronate has been linked in long-term users to the development of low-impact femoral Alendronic acid or Alendronate, sold under the brand name Fosamax among others, is a bisphosphonate medication used to treat osteoporosis and Paget's disease of bone, which works by decreasing the activity of osteoclasts, the cells that break down bone. ibandronic acid (IV Boniva), and zoledronic acid (Reclast) dcf1ff1a26

This condition was previously known as bisphosphonate-related osteonecrosis of the jaw (BON or BRONJ) because osteonecrosis of the jaw correlating with bisphosphonate treatment was frequently encountered, with its first incident occurring in 2003. Osteonecrotic complications associated with denosumab, another antiresorptive drug from a different drug category, were soon determined to be related to this condition. Newer medications such as anti-angiogenic drugs have been potentially implicated causing... dcf1ff1a26

Medication-related osteonecrosis of the jaw may result in delayed soft tissue healing. It may lead to surgical complication in the form of impaired wound healing following oral and maxillofacial surgery, periodontal surgery, or

endodontic therapy. Examples of bisphosphonates: : Zoledronic acid (Reclast, Zometa), Risedronate (Actonel), Alendronate (Fosamax) Medication-related osteonecrosis of the jaw (MON, MRONJ) is progressive death of the jawbone in a person exposed to a medication known to increase the risk of disease, in the absence of a previous radiation treatment

Common side effects (1 to 10% of patients) include constipation, abdominal pain, nausea, and acid reflux; though the rate of all side effects were found by the Fracture Intervention Trial, which followed 2,027 women with osteoporosis for three years, to be nearly identical to that of the placebo. The study further found that the risk of a serious upper gastrointestinal adverse event was 60% lower ($p < 0.01$) for the drug versus the placebo. Use is not recommended during pregnancy or in those with poor kidney function.
