KIR2DL1 with KIR2DL1 but the patient does not have enough HLA-C2 ligand, the NK cells will then be able to destroy the leukemia cells since they can then bind Killer cell immunoglobulin-like receptor 2DL1 is a protein that in humans is encoded by the KIR2DL1 gene cc8f8d4ec8

KIR2DL1 is an important receptor that is usually found on Natural Killer Cells (NK Cells). This receptor's job is to send inhibitory signals. This means that the receptor will communicate with a cell and tell it to stop what it is doing when it is not needed. This usually happens when a cell is healthy and does not need NK cells to release toxic proteins to kill that healthy cell. This receptor specifically recognizes HLA-C2 molecules on these healthy cells, which are just proteins that help receptors know they are a healthy cell. KIR2DL1 is important because it helps our immune system stay healthy. Our KIR2DL1 receptors are needed to tell our body and other cells what needs to be killed and what is important to stay because it is healthy for us. Without our KIR2DL1 receptors identifying the bad, the bad cells might start attacking our bodies without the NK cells even knowing they had a job to do. As well as
