

Hepatitis B Icd 10

Anomalous presentation of MHC class II receptors on the surface of liver cells, possibly due to genetic predisposition or acute liver infection, causes a cell-mediated immune response against the body's own liver, resulting in autoimmune hepatitis. This abnormal immune response results in inflammation of the liver, which can lead to further symptoms and complications such as fatigue and cirrhosis. The disease is most often diagnosed in patients in their late teens or early 20s and between... 89bda919f6

Hepatitis A When symptoms occur, they typically last eight weeks and may include nausea, vomiting, diarrhea, jaundice, fever, and abdominal pain. The time between exposure and symptoms, in those who develop them, is two to six weeks. Around 10–15% of people experience a recurrence of symptoms during the six months after the initial infection. Hepatitis A is an infectious, vaccine-preventable liver disease caused by Hepatitis A virus (HAV); it is a type of viral hepatitis. Many cases have few Hepatitis A is an infectious, vaccine-preventable liver disease caused by Hepatitis A virus (HAV); it is a type of viral hepatitis. Acute liver failure may rarely occur, with this being more common in the elderly. Many cases have few or no symptoms, especially in the young 89bda919f6

Hepatitis X The disease involves swelling and inflammation of the liver. Symptoms of non-A-E hepatitis may include tiredness Non-A-E hepatitis, also known as hepatitis X, is an infectious disease of the liver referring to a case of viral hepatitis that cannot be attributed to hepatitis A, B, C, D, or E. be attributed to hepatitis A, B, C, D, or E. The disease involves swelling and inflammation of the liver 89bda919f6

Autoimmune hepatitis Common initial symptoms may include fatigue, nausea, muscle aches, or weight loss or signs of acute liver inflammation including fever, jaundice, and right upper quadrant abdominal pain. Individuals with autoimmune hepatitis often have no initial symptoms and the disease may be detected by abnormal liver function tests and increased protein levels during routine bloodwork or the observation of an abnormal-looking liver during abdominal surgery. Autoimmune hepatitis, formerly known as lupoid hepatitis, plasma cell hepatitis, or autoimmune chronic active hepatitis, is a chronic, autoimmune disease Autoimmune hepatitis, formerly known as lupoid

hepatitis, plasma cell hepatitis, or autoimmune chronic active hepatitis, is a chronic, autoimmune disease of the liver that occurs when the body's immune system attacks liver cells, causing the liver to be inflamed 89bda919f6

Hepatitis B is mainly sexually transmitted, but Hepatitis is inflammation of the liver tissue. Some people or animals with hepatitis have no symptoms, whereas others develop yellow discoloration of the skin and whites of the eyes (jaundice), poor appetite, vomiting, tiredness, abdominal pain, and diarrhea. non-alcoholic steatohepatitis (NASH). Hepatitis A and E are mainly spread by contaminated food and water. Acute hepatitis can resolve on its own, progress to chronic hepatitis, or (rarely) result in acute liver failure. Chronic hepatitis may progress to scarring of the liver (cirrhosis), liver failure, and liver cancer. Hepatitis is acute if it resolves within six months, and chronic if it lasts longer than six months 89bda919f6

Symptoms of non-A-E hepatitis may include tiredness, nausea, vomiting, abdomen pain, and fever. The specific cause of non-A-E hepatitis is unknown. It is considered a rare disorder. 89bda919f6 The most common types of hepatitis can be prevented or treated. Hepatitis... 89bda919f6 HCV is spread primarily by blood-to-blood contact associated with injection drug use, poorly sterilized medical equipment, needlestick injuries in healthcare, and transfusions. In regions where blood screening has been implemented, the risk of contracting HCV from a transfusion has dropped substantially to less than one per two million. HCV may also be spread from an infected mother to her baby during birth. It is not spread through breast milk, food, water, or casual contact such as hugging, kissing, and... 89bda919f6 HDV infecting a person with chronic hepatitis B (superinfection) is considered the most serious type of viral hepatitis due to its severity of complications. These complications include a greater likelihood of experiencing liver failure in acute infections and a rapid progression to liver cirrhosis, with an increased risk of developing liver cancer in chronic infections. In combination with hepatitis B virus, hepatitis D has the highest fatality rate of all the hepatitis infections, at 20%. A recent estimate from 2020 suggests that currently 48 million people are infected with this virus. 89bda919f6 Like hepatitis A, hepatitis E usually follows an acute and self-limiting course of illness (the condition is temporary and the individual recovers) with low death rates in resource-rich areas; however, it can be more severe in pregnant women and people with a weakened immune system, with substantially higher death rates. In pregnant women, especially in the third trimester, the disease is more often severe and is associated with a clinical syndrome called fulminant

liver failure, with death rates around 20%. Whereas pregnant women may have a rapid and severe course, organ transplant recipients who receive medications to weaken the immune system and prevent organ rejection can develop a slower and more persistent form called chronic hepatitis E, which is so diagnosed after 3 months of continuous...

89bda919f6 Hepatitis is most commonly caused by the virus hepatovirus A, B, C, D, and E. Other viruses can also cause liver inflammation, including cytomegalovirus, Epstein-Barr virus, and yellow fever virus. Other common causes of hepatitis include heavy alcohol use, certain medications, toxins, other infections, autoimmune diseases, and non-alcoholic steatohepatitis (NASH). Hepatitis A and E are mainly spread by contaminated food and water. Hepatitis B is mainly sexually transmitted, but may also be passed from mother to baby during pregnancy or childbirth and spread through infected blood. Hepatitis C is commonly spread through... 89bda919f6

Hepatitis D HDV is one of five known hepatitis viruses: A, B, C, D, and E. Hepatitis D is a type of viral hepatitis caused by the hepatitis delta virus (HDV). Transmission of HDV can occur either via simultaneous infection with HBV (coinfection) or superimposed on chronic hepatitis B or hepatitis B carrier state (superinfection). HDV Hepatitis D is a type of viral hepatitis caused by the hepatitis delta virus (HDV). HDV is one of five known hepatitis viruses: A, B, C, D, and E. HDV is considered to be a satellite (a type of subviral agent) because it can propagate only in the presence of the hepatitis B virus (HBV) 89bda919f6

The hepatitis... 89bda919f6 Many people have no symptoms after exposure. For others, symptoms may appear 30 to 180 days after exposure and can include a rapid onset of sickness with nausea, vomiting, yellowish skin, fatigue, yellow urine, and abdominal pain. Symptoms during acute infection typically last for a few weeks, though some people may feel sick for up to six months. Deaths resulting from acute stage HBV infections are rare. An HBV infection lasting longer than six months is usually considered chronic. The likelihood of developing chronic hepatitis B is higher for those who are infected with HBV at a younger age. About 90% of those infected during or shortly after birth develop chronic hepatitis B, while less than 10% of those infected after the age of five develop chronic cases. Most of those with chronic disease have no symptoms; however, cirrhosis and liver cancer eventually develop in about 25% of those with chronic HBV. 89bda919f6

Hepatitis B It can cause both acute and chronic infection. It can cause both acute Hepatitis B is an infectious disease caused by the hepatitis B virus (HBV) that affects the liver; it is a type of viral hepatitis. Hepatitis B

is an infectious disease caused by the hepatitis B virus (HBV) that affects the liver; it is a type of viral hepatitis 89bda919f6

The most common causes of viral hepatitis are the five unrelated hepatotropic viruses hepatitis A, B, C, D, and E. Other viruses can also cause liver inflammation, including cytomegalovirus, Epstein-Barr virus, and yellow fever. There also have been scores of recorded cases of viral hepatitis caused by herpes simplex virus. 89bda919f6 The virus is transmitted by exposure to infectious blood or body fluids. In areas where the disease is... 89bda919f6 == Mode of transmission == 89bda919f6 == References == 89bda919f6 == Virology == 89bda919f6

Hepatitis E Hepatitis E has mainly a fecal-oral transmission route that is similar to hepatitis A, although the viruses are unrelated. Hepatitis E has mainly Hepatitis E is inflammation of the liver caused by infection with the hepatitis E virus (HEV); it is a type of viral hepatitis. Hepatitis E is inflammation of the liver caused by infection with the hepatitis E virus (HEV); it is a type of viral hepatitis. HEV is a positive-sense, single-stranded, nonenveloped, RNA icosahedral virus and one of five known human hepatitis viruses: A, B, C, D, and E 89bda919f6

List of hepato-biliary diseases Their study is known as hepatology. Their study is known as hepatology. Acute hepatitis A Acute hepatitis B Acute hepatitis C Acute hepatitis D – this is a superinfection with the delta-agent Hepato-biliary diseases include liver diseases and biliary diseases 89bda919f6

It is typically a foodborne illness, usually spread by eating food or drinking water contaminated with infected feces. Undercooked or raw shellfish are relatively common sources. It may also be spread through close contact with an infectious person. While children often do not have symptoms when infected, they are still able to infect others. After a single infection, a person is immune for the rest of their life. Diagnosis requires blood testing, as the symptoms are similar to those of a number of other diseases. It is one of five known hepatitis viruses: A, B, C, D, and E. 89bda919f6

Viral hepatitis types of hepatitis can be prevented or treated. Effective treatments for hepatitis C are available Viral hepatitis is liver inflammation due to a viral infection. It may present in acute form as a recent infection with relatively rapid onset, or in chronic form, typically progressing from a long-lasting asymptomatic condition up to a decompensated hepatic disease and hepatocellular carcinoma (HCC).

Hepatitis A and hepatitis B can be prevented by vaccination 89bda919f6

== Liver diseases == 89bda919f6 Viral hepatitis is either transmitted through contaminated food or water (A, E) or via blood and body fluids (B, C). The viruses transmitted through water and food are mostly self-limited, resulting in acute illness with full resolution. The blood borne viruses (B, C) can cause both acute and chronic liver disease and can be transmitted from mother to child during birth, through contact with body fluids during sex, unsafe injections and through unscreened blood transfusions. 89bda919f6

Hepatitis C Early symptoms can include fever, dark urine, abdominal pain, and jaundice. Early on, chronic infection typically has no symptoms. During the Hepatitis C is an infectious disease caused by the hepatitis C virus (HCV) that primarily affects the liver; it is a type of viral hepatitis. Hepatitis C is an infectious disease caused by the hepatitis C virus (HCV) that primarily affects the liver; it is a type of viral hepatitis. The virus persists in the liver, becoming chronic, in about 70% of those initially infected. Over many years, however, it often leads to liver disease and occasionally cirrhosis. During the initial infection period, people often have mild or no symptoms. In some cases, those with cirrhosis will develop serious complications such as liver failure, liver cancer, or dilated blood vessels in the esophagus and stomach 89bda919f6
