Nasal congestion can interfere with hearing and speech. Significant congestion may interfere with sleep, cause snoring, and can be associated with sleep apnea or upper airway resistance syndrome. In children, nasal congestion from enlarged adenoids has caused chronic sleep apnea with insufficient oxygen levels and hypoxia. The problem usually resolves after surgery to remove the adenoids and tonsils; however, the problem often relapses later in life due to craniofacial alterations from chronic nasal congestion. fb6ab78f43 In about 85% of cases, nasal congestion leads to mouth breathing rather than nasal breathing.
