The Early Language Milestone It is one of the first lines in the investigation process in diagnosing the delay, and also one of the tools for monitoring the progression. Because of the high sensitivity, it is used as a language-specific screener in the primary care setting in regard to development and growth. This scale initially included 41 milestones, each reflecting typical developmental expectations for early language skills The Early Language Milestone Scale (The ELM Scale) is one of the tools for detecting and measuring language delays in children. It provides a quick screening-evaluation approach and gives promise for meeting the criticisms directed at most of the other screeners. children aged 0 to 36 months

In 1990, Coplan and Gleason have developed the ELM scale to standardise the screening tools that evaluate speech and language development in children from birth to 36 months. This was constructed to mitigate the existing problems of language development assessments, namely time-consuming, required specialist training, and impractical for general paediatricians. Hence, this value-added feature to clinical practices enables the ELM scale to evolve as one of the most widely used instruments in early childhood language assessment by 1990s.
