Breast volume will have an effect on the perception of a woman's figure even when bust/waist/hip measurements are nominally the same. Brassière band size is measured below the breasts, not at the bust. A woman with measurements of 36A-27-38 will have a different presentation than a woman with measurements of 34C-27-38. These women have ribcage circumferences differing by 2 inches, but when breast tissue is included, the measurements are the same at 38 inches. The result is that the latter woman will appear "bustier" than the former due to the apparent difference in bust to hip ratios (narrower shoulders, more prominent breasts) even though... == Measurement ==

Hip replacement Patient satisfaction varies widely between different techniques and implants. Hip replacement is a surgical procedure in which the hip joint is replaced by a prosthetic implant, that is, a hip prosthesis. Hip replacement surgery can be performed as a total replacement or a hemi/semi(half) replacement. A total hip replacement (total hip arthroplasty) consists of replacing both the acetabulum and the femoral head while hemiarthroplasty generally only replaces the femoral head. The average cost of a total hip replacement in 2012 was \$40,364 in the United States (about €37,300), and in the range of €7,117 to €11,091 in most European countries. Such joint replacement orthopaedic surgery is generally conducted to relieve arthritis pain or in some hip fractures. Approximately 58% of total hip replacements are estimated to last 25 years. Female figures are typically narrower at the waist than at the bust and hips. The bust, waist, and hips are called inflection points, and the ratios of their circumferences are used to define basic body shapes. == Physiology == People have altered their silhouettes via hip and buttock padding to achieve desired silhouette shapes for centuries. In the 1500s and 1600s in Europe, the bum roll, or roll farthingale, was used to

widen the appearance of the hips in contrast to the wearer's waist and create a fashionable feminine figure. Crinolines and hoop skirts were used in the 1800s, emphasizing a rounded full lower silhouette, and later a conical lower silhouette, with volume shifting towards the back. These were replaced by bustles, which appeared in 1868, and focused on keeping a flat silhouette in front while adding volume to the back.

Manufacturers' bra size labelling systems vary by country because no comprehensive international standards exist. Size inconsistency has existed since at least 1937. In Sears' 1937 catalog, a size 14 dress had a bust size of 32 inches (81 cm). In 1967, the same bust size was a size 8. In 2011, it was a size 0. Some argue that vanity sizing is designed to satisfy wearers' wishes to appear thin and feel better about themselves. This works by adhering to the theory of compensatory self-enhancement, as vanity sizing promotes a more positive self-image of one upon seeing a smaller label. 9e57f403b9 ==

Bust/waist/hip measurements They match Bust/waist/hip measurements (informally called 'body measurements' or 'vital statistics') are a common method of specifying clothing sizes. In human body measurement, these three sizes are the circumferences of the bust, waist and hips; usually rendered as xx-yy-zz in inches, or centimeters. The three sizes are used mostly in fashion, and almost exclusively in reference to women, who, compared to men, are more likely to have a narrow waist relative to their hips.
