Bed bug bites are caused primarily by two species of insects: Cimex lectularius (the common bed bug) and Cimex hemipterus, found primarily in the tropics. Their size ranges between 1 and 7 mm. They spread by crawling between nearby locations or by being carried within personal items. Infestation is rarely due to a lack of hygiene but is more common in high-density areas. Diagnosis involves both finding the bugs and the occurrence of compatible symptoms. Bed bugs spend much of their time in dark, hidden locations like mattress seams, or cracks in a wall. 827299c330

The research has been criticized for its methodology and because sexual activity decreases for all long-term couples regardless of sexual orientation. Analyses of the concept have therefore regarded it as a popular myth. The concept was mentioned by JoAnn Loulan in *Lesbian Sex* (1984), although her research was more focused on debunking the idea that lesbians are inherently less sexual people than others. A German study has shown that the female sex drive greatly diminishes once she is in a secure relationship.
