A computer program in its human-readable form is called source code. Source code needs another computer program to execute because computers can only execute their native machine instructions. Therefore, source code may be translated to machine instructions using a compiler written for the language. (Assembly language programs are translated using an assembler.) The resulting file is called an executable. Alternatively, source code may execute within an interpreter written for the language. 7e637eae7c

Computer programming Programmers typically use high-level programming languages that

are more easily intelligible to humans than machine code, which is directly executed by the central processing unit. It involves designing and implementing algorithms, step-by-step specifications of procedures, by writing code in one or more programming languages. Proficient programming usually requires expertise in several different subjects, including knowledge of the application domain, details of programming languages and generic code libraries, specialized algorithms, and formal logic. Computer Modern digital electronic computers can perform generic sets of operations known as programs, which enable computers to perform a wide range of tasks. electronic computers can perform generic sets of operations known as programs, which enable computers to perform a wide range of tasks. The term computer system A computer is a machine that can be programmed to automatically carry out sequences of arithmetic or logical operations (computation). The term computer system may refer to a nominally complete computer that includes the hardware, operating system, software, and peripheral equipment needed and used for full operation, or to a group of computers that are linked and function together, such

as a computer network or computer cluster 7e637eae7c

Numbering only a few in the 1930s, today computers are ubiquitous over a broad range of industrial and consumer products that use computers as control systems. The price, size, and complexity of computers can range from simple single-purpose devices like key fobs, microwave ovens, and remote controls up to supercomputers and factories using industrial robots. Computers are at the core of general-purpose devices such as personal computers and mobile devices, such as smartphones. Computers power the Internet, which links billions of computers and users. 7e637eae7c

Agent describes whether additional software daemons are required. Depending on the management software these agents are usually deployed on the target system or on one or many central controller servers. Although Agent-less = No is colored red and might seem to be a negative, instead, having an agent can be considered quite advantageous to many. Consider the impact if an agent-less tool loses connectivity to a node while making critical changes—leaving the node in an indeterminate state that compromises its (production?) function. 7e637eae7c Installation typically involves files containing program code and data being copied/generated from the installation to new files on the local computer for easier access by the operating system, creating necessary directories, registering environment variables, providing a separate program for un-installation etc. Because program files are

generally copied/generated in multiple locations, uninstallation usually involves more than just erasing the program folder. For example, registry... 7e637eae7c The Information System Design and Optimization System (ISDOS) project, started in 1968 at the University of Michigan, initiated a great deal of interest in the whole concept of using computer systems to help analysts in the very difficult process of analysing requirements and developing systems. Several papers by Daniel Teichroew fired a whole generation of enthusiasts with the potential of automated systems development. His Problem Statement Language / Problem Statement Analyzer (PSL/PSA) tool was a CASE tool although it predated the term. 7e637eae7c The wide variety of types of buoyancy compensator, diving suits and types of scuba equipment means that it is important for each buddy to understand the other's equipment configuration in case one has to help or rescue the other. Buddy check The correct use of a well designed written checklist is known to be more reliable, and is more likely to be used by professional divers, where it may be required by occupational health and safety legislation, and by technical divers, where the equipment checks are more complex. buddy to understand the other's equipment configuration in case one has to help or rescue the other. By checking each other's equipment as well as their own, it is thought to be more likely that these faults will be identified prior to the start of the dive. procedure carried out by scuba divers using the buddy system where each dive buddy checks that the other's diving equipment is configured and functioning correctly just before the start of the dive. A study of pre-dive equipment checks done by individual divers showed that divers often fail to recognize common equipment faults

If the executable is requested for execution, then the operating system loads it into memory and starts a process. The central processing unit will soon switch to this process so it can fetch, decode, and then execute each machine instruction.

CAD software for mechanical design uses either vector-based graphics to depict the objects of traditional drafting, or may also produce raster graphics showing the overall appearance of designed objects. However, it involves more than just shapes. As in the manual drafting of technical and engineering...

Introduction to the delivery process

As can be seen in figure one, the delivery phase is in between the release phase and the deployment phase. A software vendor develops and releases a software product and afterwards it has to be transported to the customer. This phase is the delivery process. This process is highly complex because the vendor often has to deal with a product which has multiple versions, variable features, dependency on external products, and different kinds of distribution

options. The CCU method helps the software vendor... Auxiliary tasks accompanying and related to programming include analyzing requirements, testing, debugging (investigating and fixing problems), implementation of build systems, and management of derived artifacts, such as programs' machine code. While these are sometimes considered programming, often the term software development is used for this larger overall process – with the terms programming, implementation, and coding reserved for the writing and editing of code per se. Sometimes software... Its use in designing electronic systems is known as electronic design automation (EDA). In mechanical design it is known as mechanical design automation (MDA), which includes the process of creating a technical drawing with the use of computer software. "Verify mode" (also called dry run) refers to having an ability to determine whether a node is conformant with a guarantee of not modifying it, and typically involves the exclusive use of an internal language supporting read-only mode for all potentially system-modifying operations. Mutual authentication (mutual auth) refers to the client verifying the server and vice versa.

Computer-aided design The terms computer-aided drafting (CAD) and computer-aided design and drafting (CADD) are also used. Designs made through CAD software help protect

products and inventions when used in patent applications. This software is used to increase the productivity of the designer, improve the quality of design, improve communications through documentation, and to create a database for manufacturing. CAD output is often in the form of electronic files for print, machining, or other manufacturing operations. This Computer-aided design (CAD) is the use of computers (or workstations) to aid in the creation, modification, analysis, or optimization of a design. As described in the general entry of CCU, the delivery phase is the second phase of the CCU method. In figure one the CCU method is depicted. The phases of CCU that are not covered in this article are concealed by a transparent grey rectangle.

Installation (computer programs) Installation may be part of a larger software deployment process. A soft or digital copy of the piece of software (program) is needed to install it. Installation refers to the particular configuration of software or hardware with a view to

making it usable with the computer. A soft or digital copy of the Installation (or setup) of a computer program (including device drivers and plugins) is the act of making the program ready for execution. Because the process varies for each program and each computer, programs (including operating systems) often come with an installer, a specialised program responsible for doing whatever is needed (see below) for the installation. Installation refers to the particular configuration of software or hardware with a view to making it usable with the computer. There are different processes of installing a piece of software (program)

The delivery phase of the CCU method concerns the process which starts at the moment a product is finished until the actual shipping of the product to the customer. 7e637eae7c Building a computer at home is generally considered a cost-effective alternative to buying a pre-built one because it excludes the assembly labor cost. However, the total cost of building a computer can vary based on an individual's budget, the quality and availability of the parts used, and the discounts offered by mass production. As a result, the final cost may potentially exceed that of typical pre-built computers. 7e637eae7c Early computers were meant to be used only for calculations... 7e637eae7c
