

Ativan Headache Side Effect

== Does an atomic explosion send EM waves radiation into outer space? == 45eb06e060 Advances in pharmacology have permitted more specific targeting of receptors, and greater selectivity of agents, which necessitates greater precision when describing these agents and their effects: 45eb06e060 Common side effects include weakness, sleepiness, dizziness, decreased alertness, decreased memory formation, low blood pressure, and a decreased effort to breathe. When given intravenously, the person is typically closely monitored. Among those who are depressed, there may be an increased risk of suicide. With long-term use, tolerance may develop, with larger doses required for the same effect. Physical dependence and... 45eb06e060

Wikipedia:Reference desk/Archives/Science/2016 January 10 Yanping Nora Soong (talk) 23:36, 10 January 2016 (UTC) Even = January 10 =. antipsychotics without antihistamine activity (Latuda), benzodiazepines (like ativan) , or a Z-drug 45eb06e060

Lorazepam Lorazepam, sold under the brand name Ativan among others, is a benzodiazepine medication. It is used to treat anxiety (including anxiety disorders), insomnia, severe agitation, active seizures including status epilepticus, alcohol withdrawal, and chemotherapy-induced nausea and vomiting. It is used to treat anxiety (including anxiety disorders), insomnia Lorazepam, sold under the brand name Ativan among others, is a benzodiazepine medication. It can be given orally (by mouth), transdermally (on the skin via a topical gel or patch), intravenously (injection into a vein), or intramuscularly (injection into a muscle). It is also used during surgery to interfere with memory formation, to sedate those who are being mechanically ventilated, and, along with other treatments, for acute coronary syndrome due to cocaine use. When given by injection, onset of effects is between one and thirty minutes and effects last for up to a day 45eb06e060

Anxiolytic Benzodiazepines An anxiolytic (; also antipanic or anti-anxiety agent) is a medication or other intervention that reduces anxiety. chlordiazepoxide (Librium), clonazepam (Klonopin), diazepam (Valium), lorazepam (Ativan), clobazam (Frisium), oxazepam, temazepam, and Triazolam. Anxiolytic medications are used for the treatment of anxiety disorders and their related psychological and physical symptoms. This effect is in contrast to anxiogenic agents which increase anxiety 45eb06e060

Addiction consists of people misusing or craving the drug, not to relieve withdrawal symptoms, but to experience its euphoric or intoxicating effects. It is necessary to distinguish between addiction to and abuse of benzodiazepines, and physical dependence on them. The increased GABA inhibition on the neural systems caused by benzodiazepines is counteracted by the body's development of tolerance to the drug's effects; the development of tolerance occurs as a result of neuroadaptations, which result in decreased GABA activity and increased excitability of the glutamate... 45eb06e060 Does an atomic explosion send EM waves radiation into outer space? Would it reach other planets? --Denidi (talk) 03:26, 10 January 2016 (UTC) 45eb06e060 There is some overlap between the terms "sedative" and "hypnotic". 45eb06e060

Benzodiazepine dependence In the case of benzodiazepine dependence, the continued use seems to be typically associated with the avoidance of unpleasant withdrawal reaction rather than with the pleasurable effects of the drug. touch and pain, tremor, shakiness, muscular aches, pains, twitches, and headache. Benzodiazepine dependence develops with long-term use, even at low therapeutic doses, often without the described drug seeking behavior and tolerance. Benzodiazepine dependence and withdrawal have been associated with suicide Benzodiazepine dependence (BZD dependence) defines a situation in which one has developed one or more of either tolerance, withdrawal symptoms, drug seeking behaviors, such as continued use despite harmful effects, and maladaptive pattern of substance use, according to the DSM-IV 45eb06e060

This group is related to hypnotics. The term sedative describes drugs that serve to calm or relieve anxiety, whereas the term hypnotic describes drugs whose main purpose is to initiate, sustain, or lengthen sleep. Because these two functions frequently overlap, and because drugs in this class generally produce dose-dependent effects (ranging from anxiolysis to loss of consciousness), they are often referred to collectively as sedative-hypnotic drugs. 45eb06e060 == Nature of anxiety == 45eb06e060 Anxiety is a naturally occurring emotion and response. When anxiety levels exceed the tolerability of a person, anxiety disorders may occur. People with anxiety disorders can exhibit fear responses, such as defensive behaviors, high levels of alertness, and negative emotions. Those with anxiety disorders may have concurrent psychological disorders, such as depression. Anxiety disorders are classified using six possible clinical assessments: 45eb06e060 == Terminology == 45eb06e060

Sedative They are central nervous system (CNS) depressants and interact with brain activity, causing its deceleration. Etizolam (Etizex, Etizest) Flunitrazepam (Rohypnol, "roofies") Lorazepam (Ativan) Midazolam (Versed) Nitrazepam (Mogadon) Oxazepam (Serax) Temazepam (Restoril) A sedative, or tranquilizer, is a substance that induces sedation by reducing irritability or excitement. Various kinds of sedatives can be distinguished, but the majority of them affect the neurotransmitter gamma-aminobutyric acid (GABA). Most sedatives produce relaxing effects by increasing GABA activity 45eb06e060
